From first launch to a backed-up research library

Click the highlighted control. Check what appears. Continue to the next step.

Each task starts with its prerequisites, then uses one numbered action per screenshot. Colored numbered boxes identify controls to use or results worth checking. The task index and PDF bookmarks jump directly to procedures.

Before you begin: This guide uses generated example PDFs and an offline tablet catalog. Paths are anonymized. Your document names and results will differ. Windows file choosers and external apps vary by PC; their choices are described beside the in-app screens.

Choose a task

01	Start the Windows app	4
02	Add an existing PDF folder	6
03	Check progress and processing problems	8
04	Change extraction or Word formatting	10
05	Reconnect a moved folder	13
06	Remove a watched folder	15
07	Open a paper in Reader	17
08	Read a PDF and return to a selected result	19
09	Use Reading mode and zoom	21
10	Search across notes and PDFs	23
11	Choose fields, matching rules and note types	26
12	Find text only in the open PDF	28
13	Inspect handwriting and page context	31
14	Open a paper externally	35
15	Open or rebuild a generated notebook	37
16	Save an editable copy or export filtered notes	39
17	Export an annotated PDF	41
18	Review and save citation details	43
19	Export citations as RIS or BibTeX	46

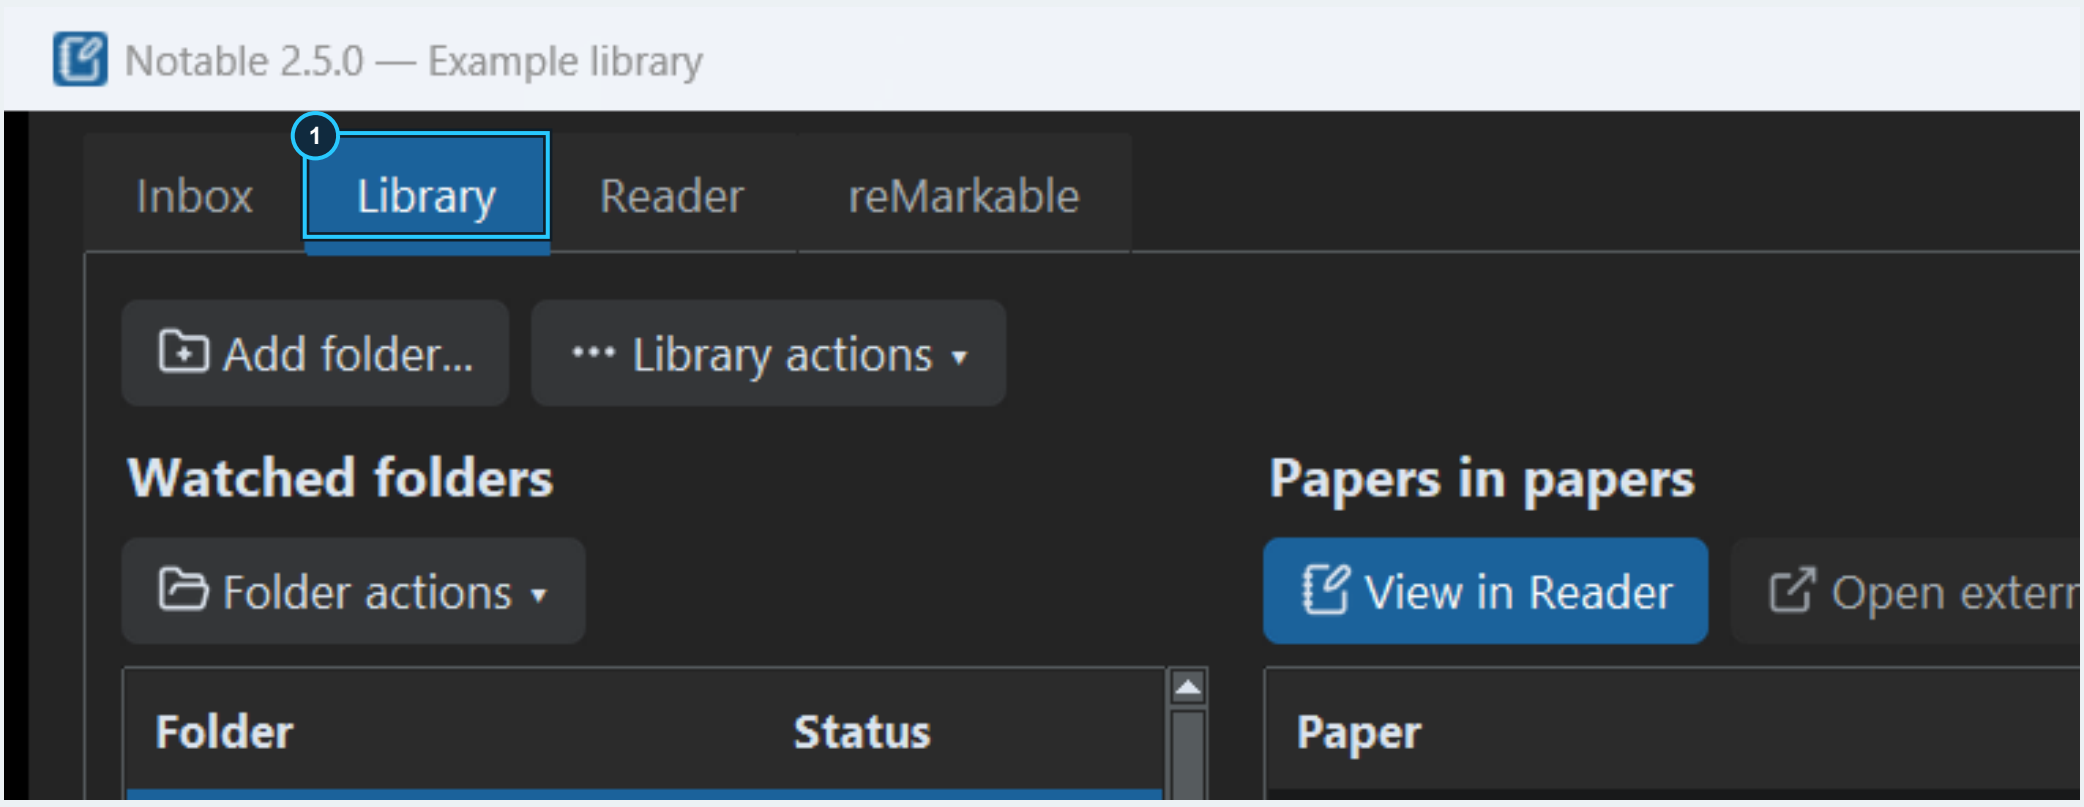

Choose a task

20	Find or attach supplementary files	48
21	Organize papers with tags and collections	51
22	Save and reuse a search	54
23	Read history, identity or an accessible view	57
24	Set up Inbox folders and naming	60
25	Review and file an incoming document	63
26	Skip, retry or recover an Inbox filing	67
27	Check a library for duplicate papers	69
28	Link selected copies or keep papers separate	72
29	Delete only reviewed local PDF copies	75
30	Enable and pair reMarkable	77
31	Choose tablet sync roots	80
32	Map a folder or handle a tablet PDF needing attention	83
33	Send a PDF and review its transfer	85
34	Create and verify a library backup	89
35	Restore a backup into a separate library	92
36	Compact storage or review old app copies	94
37	Get help, report a problem and close safely	98

Start the Windows app

1. Save Notable-2.5.0-windows-x64.exe in a permanent folder and double-click it. Let the startup splash finish, then click Library.

Start here: Download the executable, SHA256SUMS.txt and guides from the v2.5.0 GitHub release. Use Windows 10/11 x64; the embedded reader also needs Microsoft Edge WebView2 Runtime.

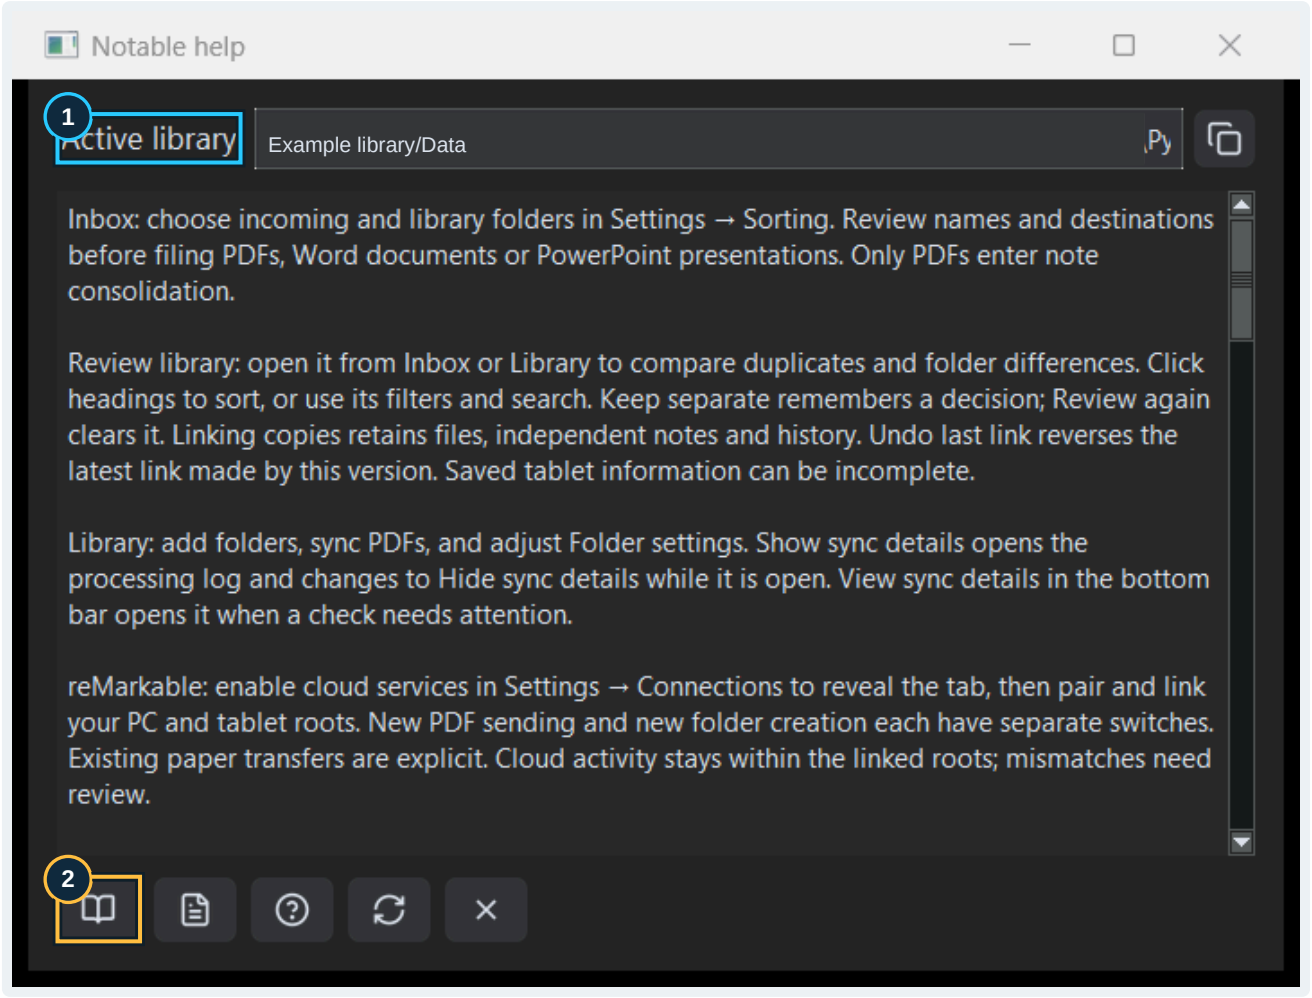

1. Open your saved PDF folders

What to expect: The saved library and controls appear together after startup. The portable executable includes Python; first launch can take a few seconds to unpack.

Start the Windows app

2. Click Help (the question-mark button), then check the version and Active library. Use Open manual or Open README for the bundled guides.

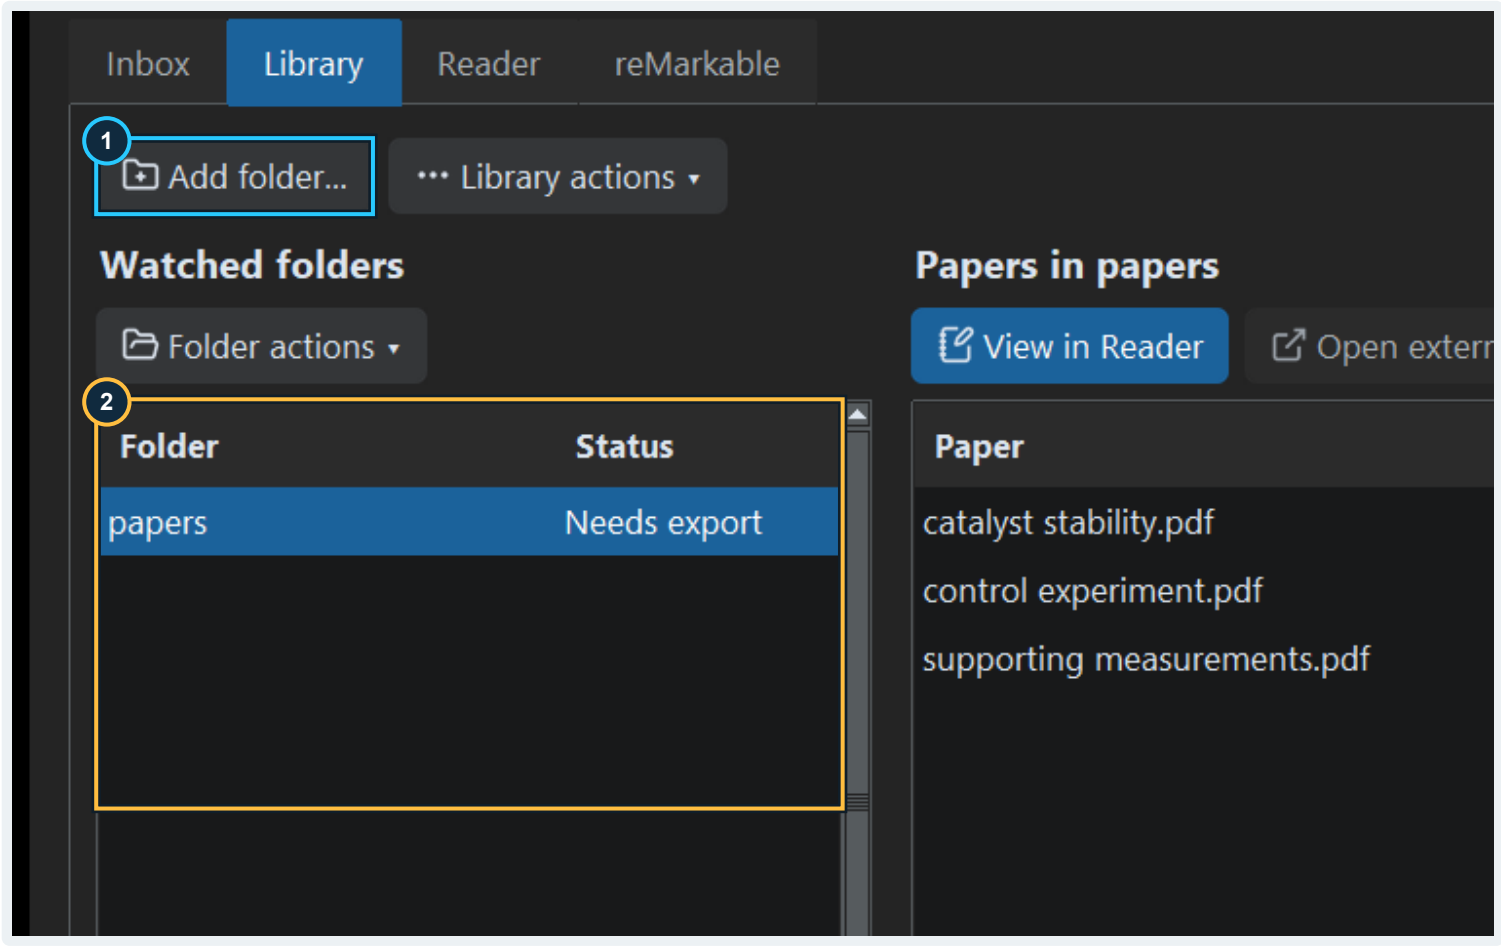

1. Check which saved library is open **2.** Open this walkthrough

What to expect: The packaged app normally uses %LOCALAPPDATA%/PDF Note Organizer. A source checkout normally uses .local-data. An explicit PDF_NOTES_DATA_DIR overrides either.

Add an existing PDF folder

1. In Library, click Add folder…; in the Windows folder chooser, select the folder containing your PDFs.

Start here: Choose a folder containing your PDFs. Adding a watched folder does not move those PDFs.

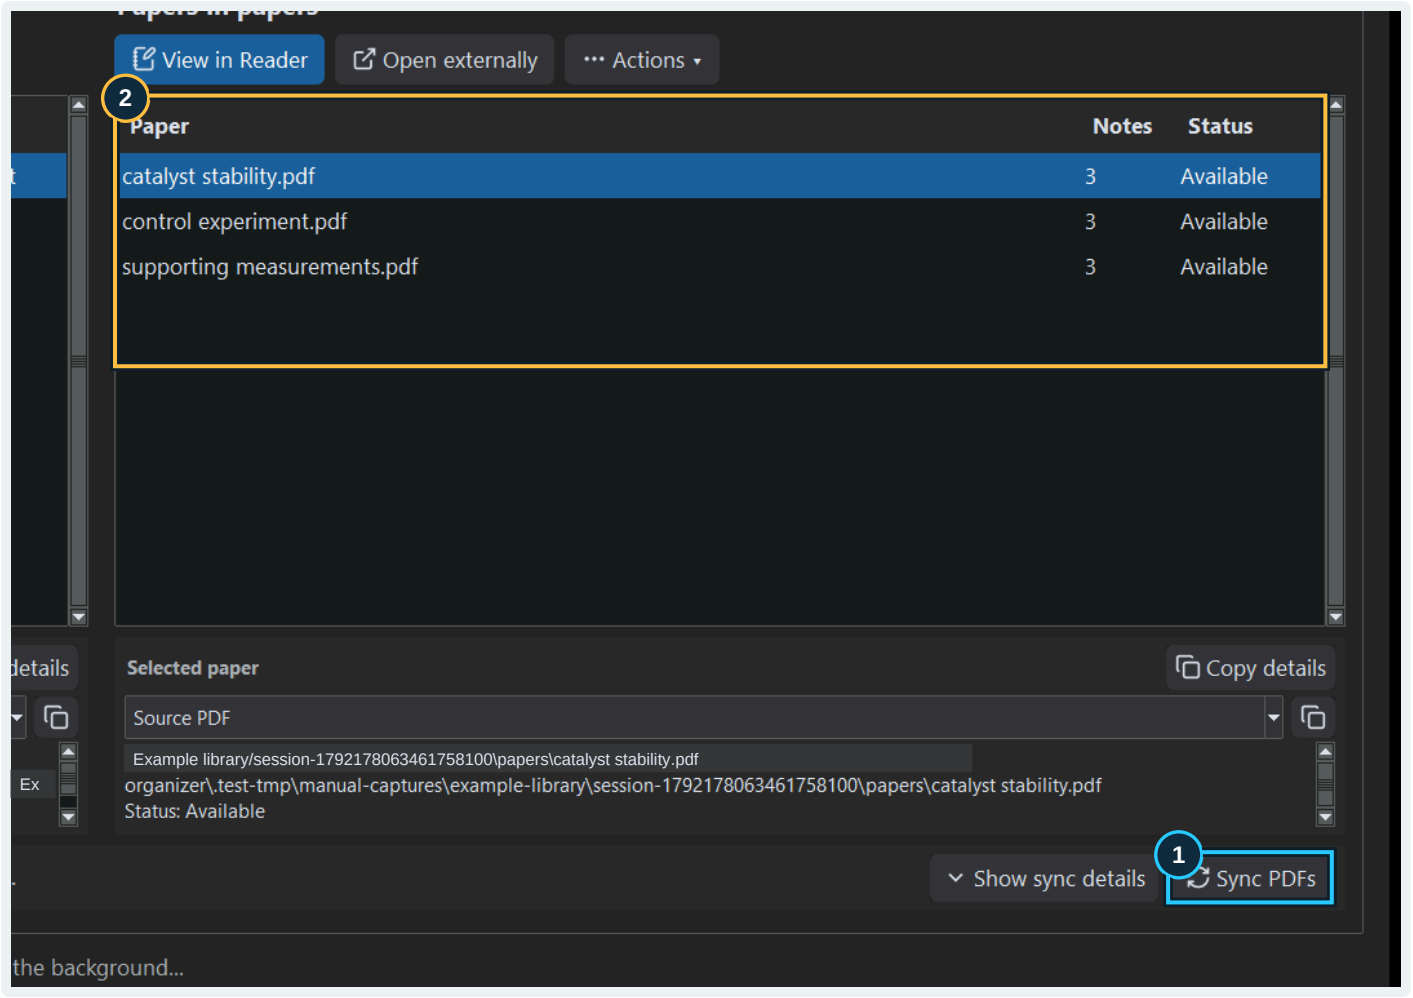

1. Choose a folder to watch **2.** The folder appears here

What to expect: The folder appears under Watched folders. Notable reads its PDFs and builds saved notes and a generated Word notebook.

Add an existing PDF folder

2. Select the watched folder, then click Sync PDFs. Wait for the activity to finish.

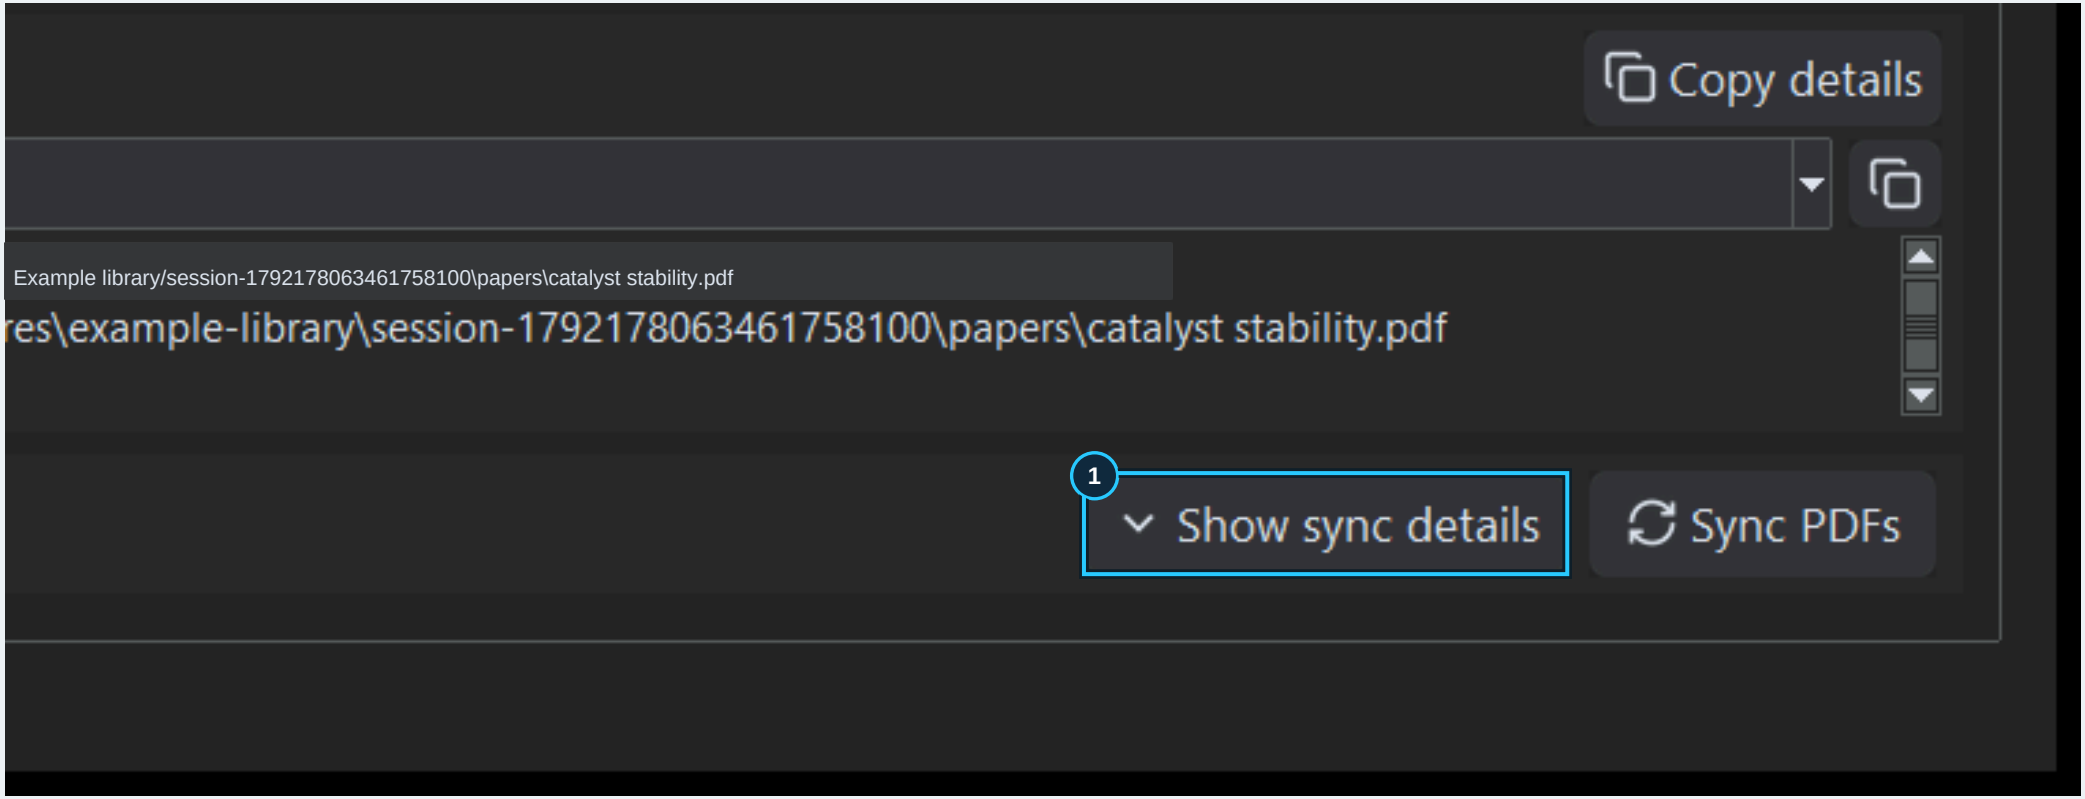

1. Read new or changed PDFs **2.** Check paper status and note counts

What to expect: The right list shows that folder's papers and note counts. Background checks continue while Notable is open.

Check progress and processing problems

1. Click Show sync details. Look at the current task and any completed/total counts in the activity area.

Start here: Use this procedure when you are unsure whether a check is running, or a paper has failed to process.

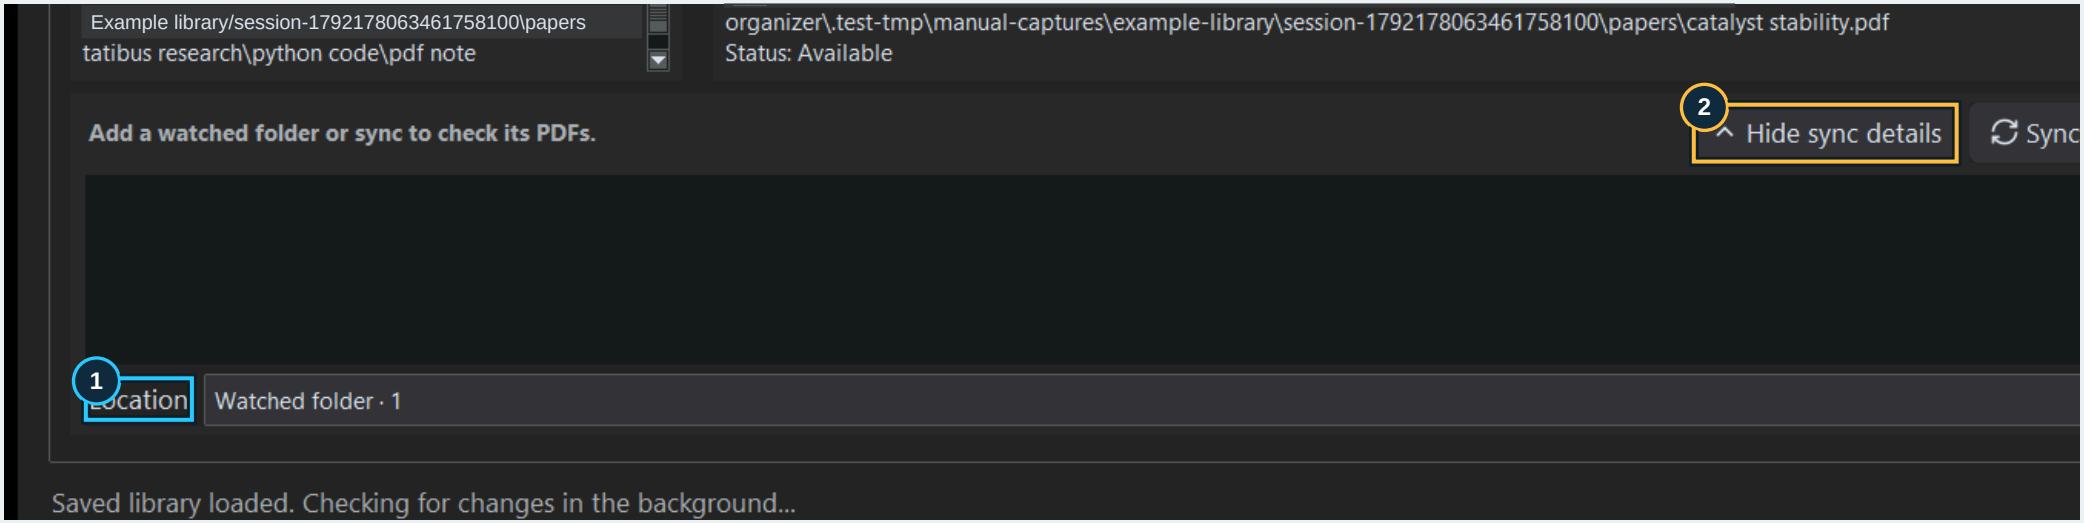

1. Open the processing log

What to expect: The details panel opens with processing messages. Counted jobs advance as items finish; jobs without a known total use a busy indicator.

Check progress and processing problems

2. Read the latest message, select a location if one is available, and use Copy full path to inspect it. Click Hide sync details when finished.

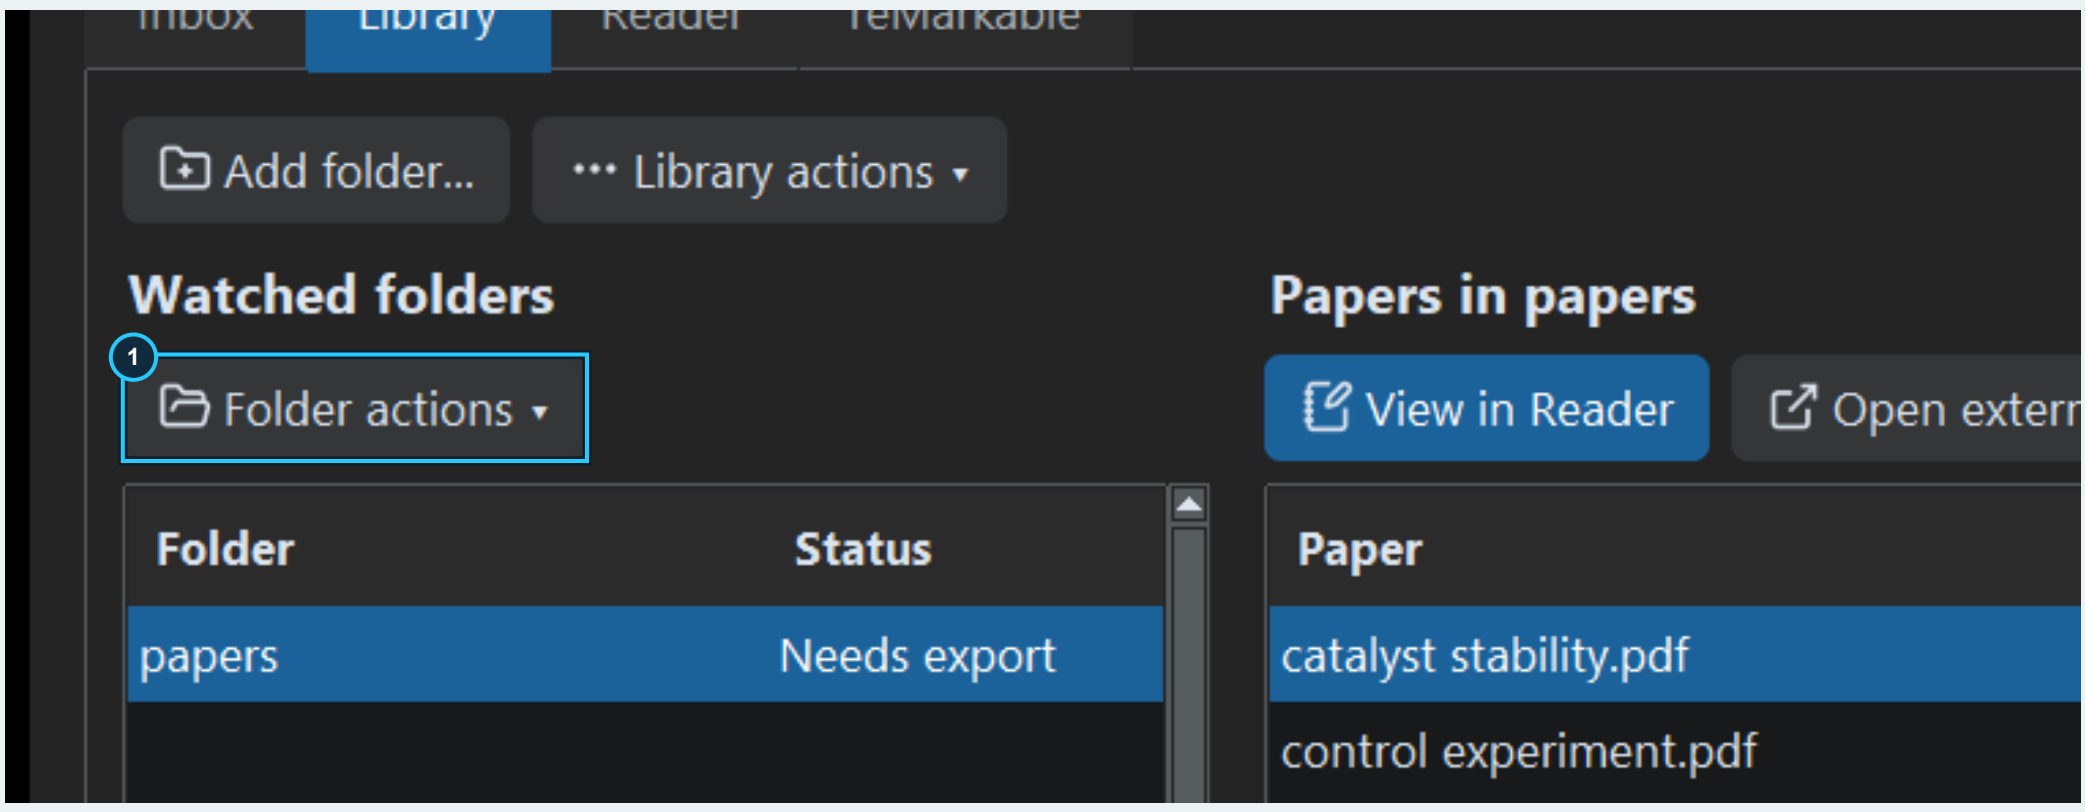

1. Choose a reported location **2.** Close the log panel

What to expect: Failures and retained recovery copies identify the relevant files. Sync PDFs retries eligible work after the underlying problem is corrected.

Change extraction or Word formatting

1. Select the watched folder and click Folder actions □.

Start here: Processing defaults apply to new watched folders. Use Folder settings for a folder already in the library.

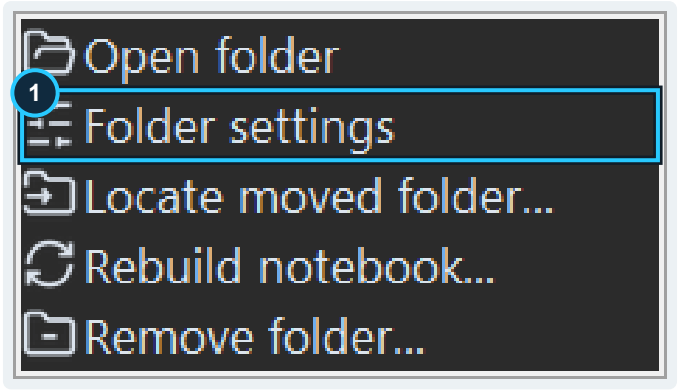

1. Open folder-specific actions

What to expect: The menu contains settings, reconnection, notebook rebuilding and removal for that selected folder.

Change extraction or Word formatting

2. Click Folder settings.

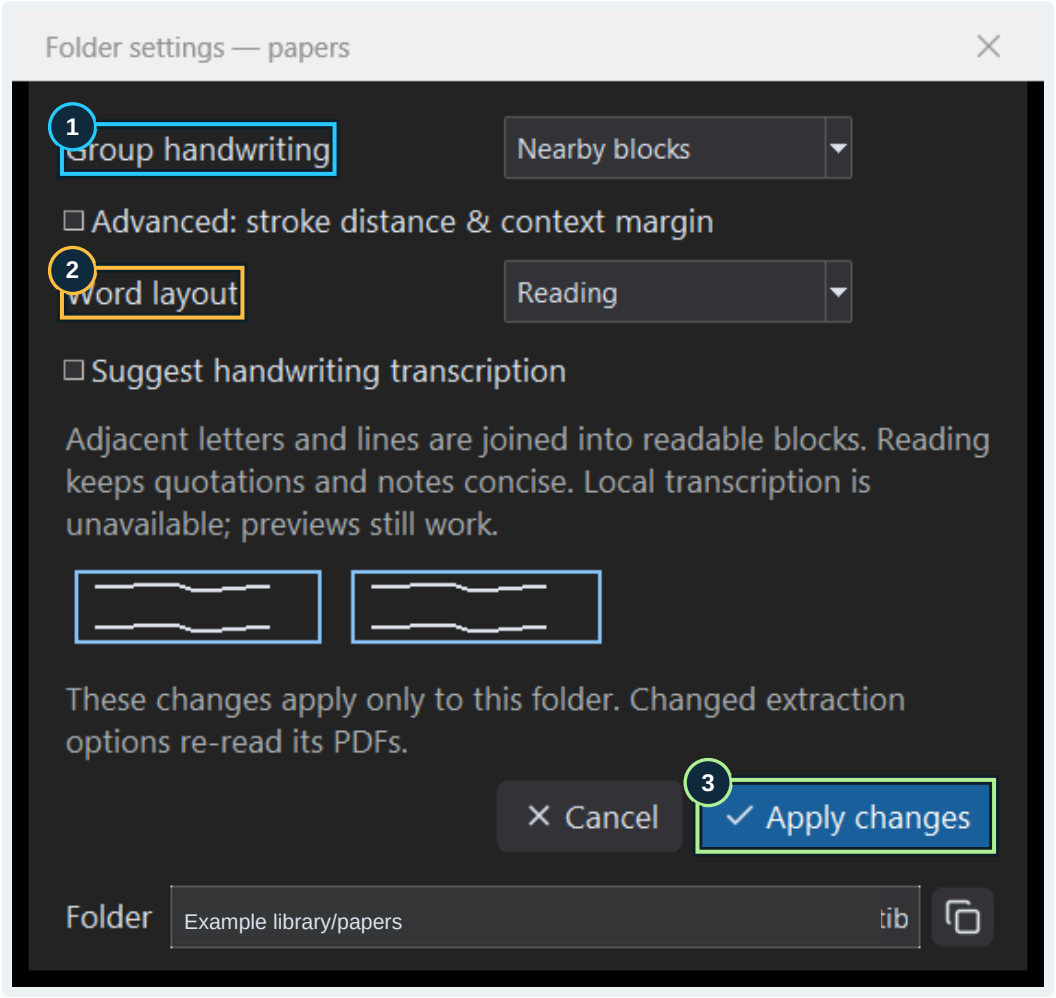

1. Edit this folder's processing

What to expect: A dialog opens for this watched folder only.

Change extraction or Word formatting

3. Choose handwriting grouping and Word layout. Expand Advanced only if you need stroke distance or context margin. Click Apply changes.

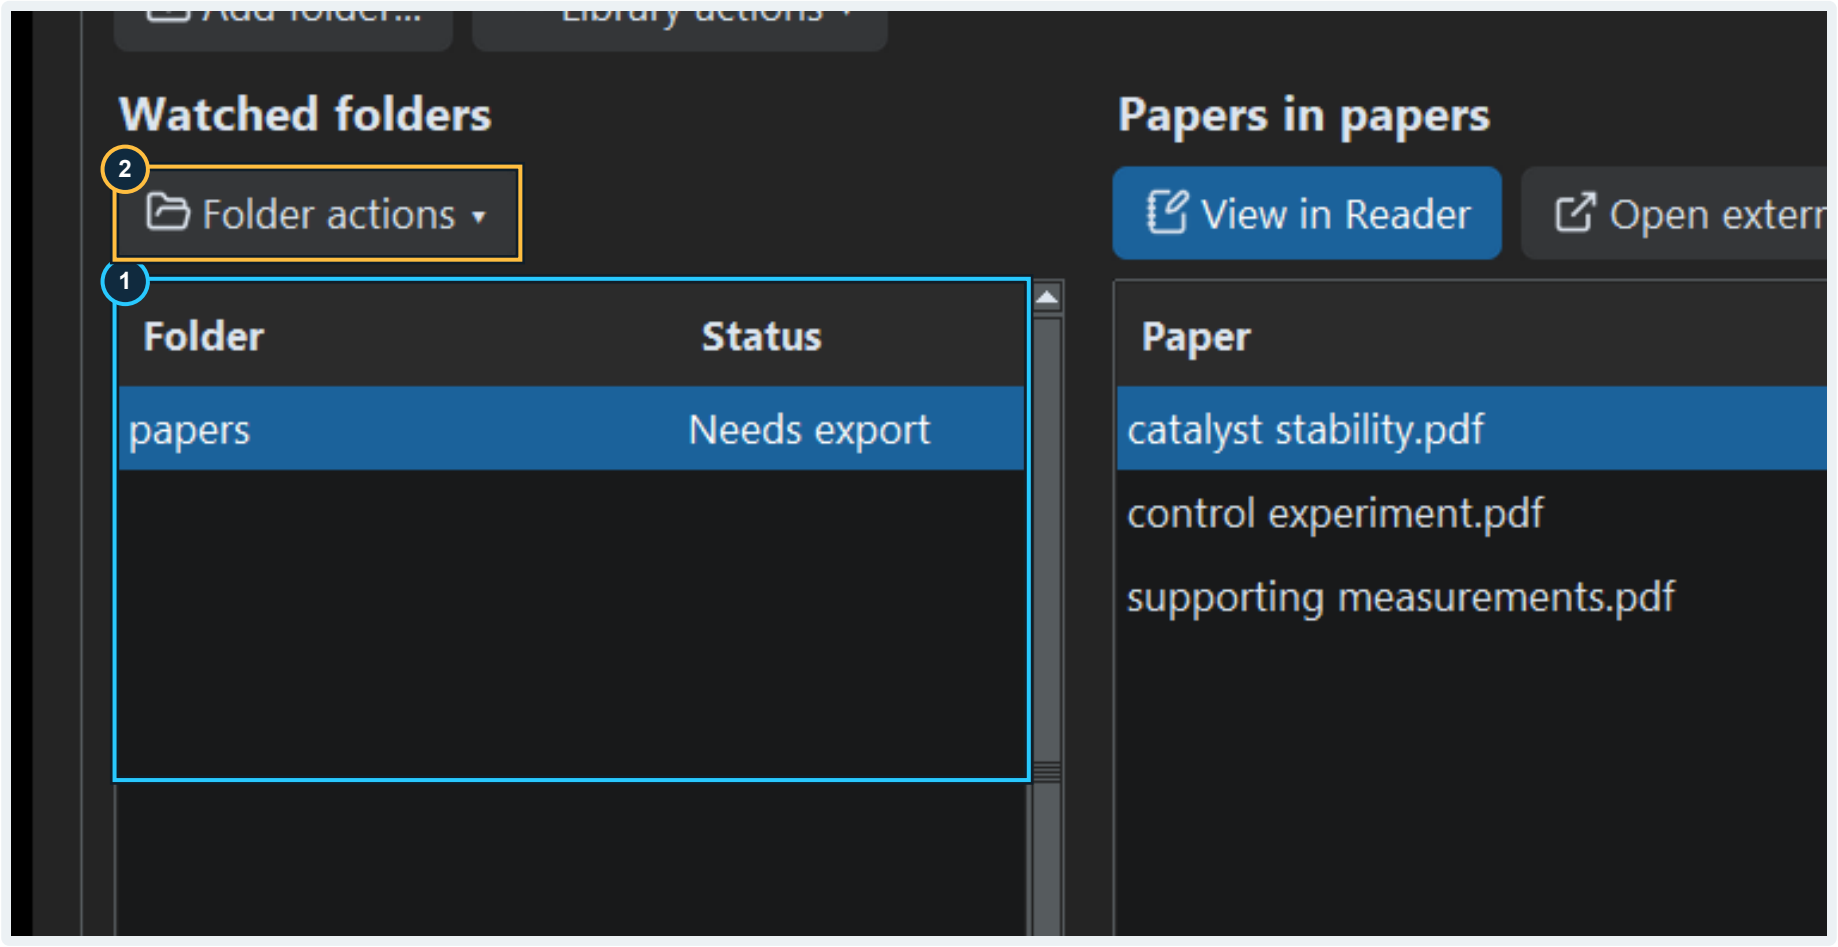

1. How nearby pen strokes are grouped **2.** Reading or Detailed layout **3.** Save this folder's settings

What to expect: Changed extraction options re-read the folder's PDFs. A formatting-only change can rebuild from saved notes. Cancel discards this draft.

Reconnect a moved folder

1. Select the unavailable watched folder and open Folder actions □.

Start here: Use this when a watched folder is unavailable because you moved or renamed it. Select its new location rather than adding a duplicate project.

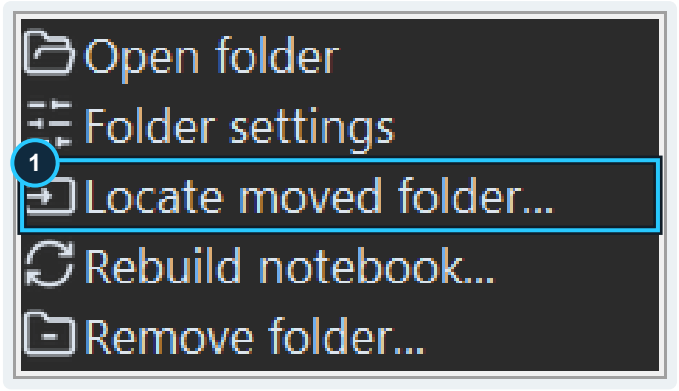

1. Select the old watched-folder entry **2.** Open reconnection actions

What to expect: The folder actions apply to the selected watched folder and its saved history.

Reconnect a moved folder

2. Click Locate moved folder… and choose the folder's new location in the Windows chooser.

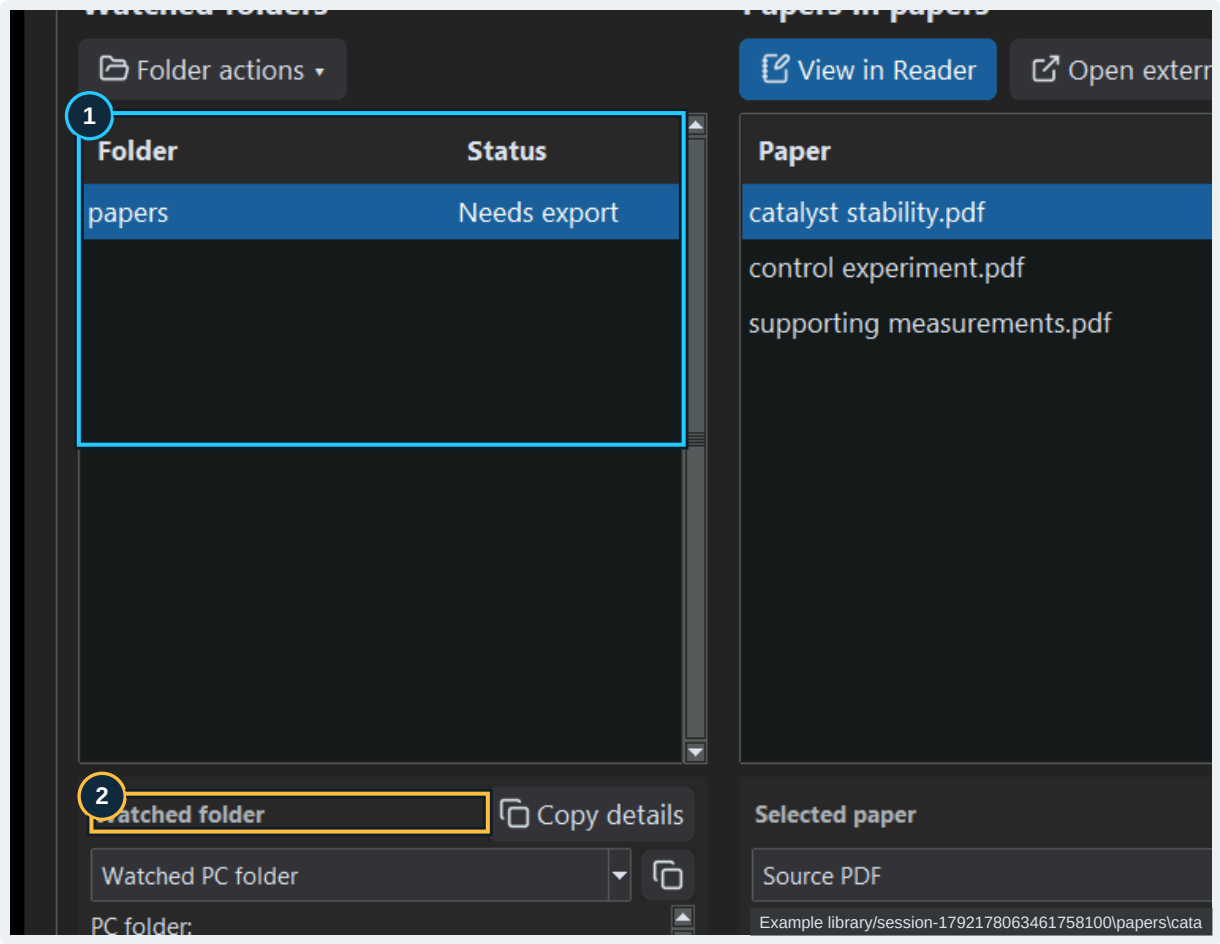

1. Choose the existing new location

What to expect: Notable reconnects saved paths and history to the new root. Sync PDFs afterwards and inspect paper status.

Remove a watched folder

1. Select the watched folder you intend to remove and open Folder actions □.

Start here: Removing a watched folder removes its saved library entries and annotation history. Its PDF files and Word notebooks stay on disk.

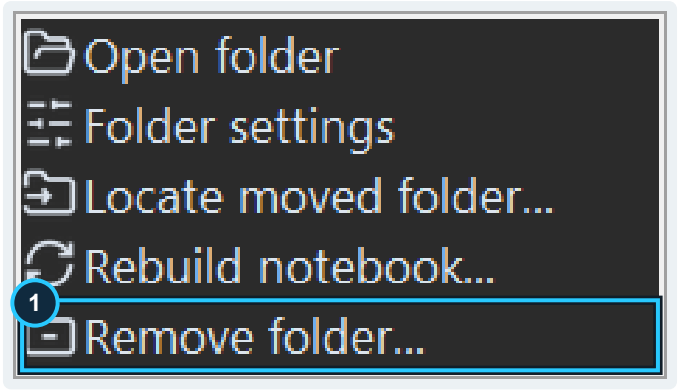

1. Select the exact folder **2.** Inspect its location

What to expect: Check the selected folder's identity and path before continuing.

Remove a watched folder

2. Click Remove folder… and read the confirmation. Confirm only if you want to remove this folder's saved library and history.

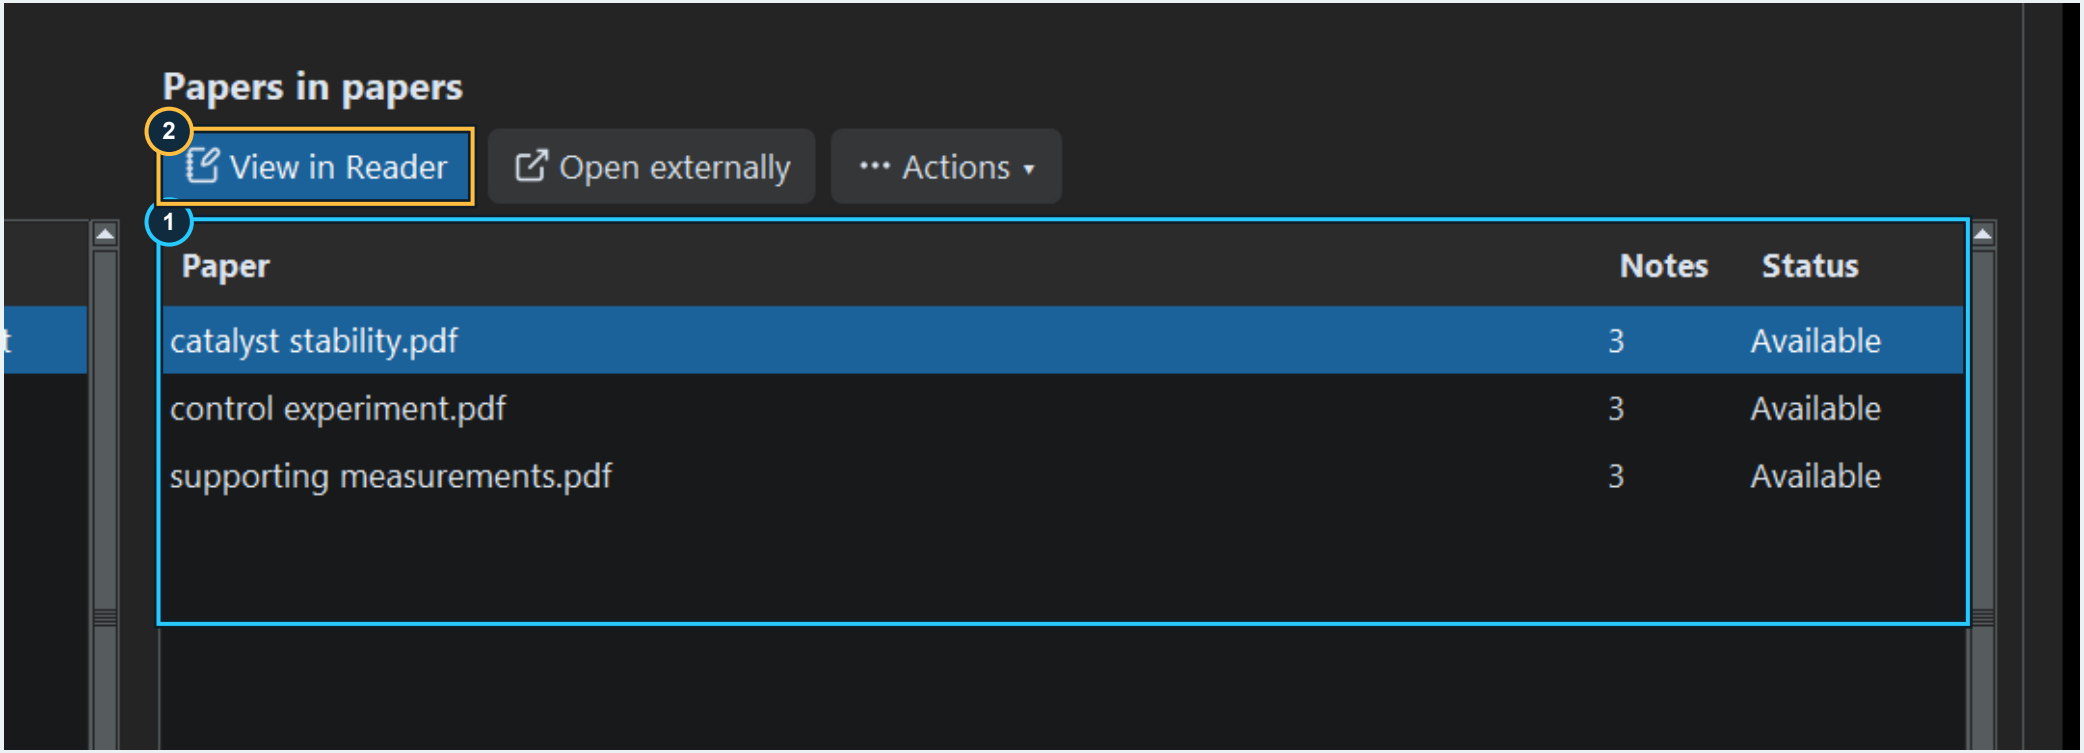

1. Review before confirming removal

What to expect: The watched-folder entry disappears after confirmation; the files on disk remain.

Open a paper in Reader

1. Select a paper and click View in Reader, or double-click the paper row.

Start here: Library shows papers in a watched folder. Reader shows the selected paper's PDF and saved notes.

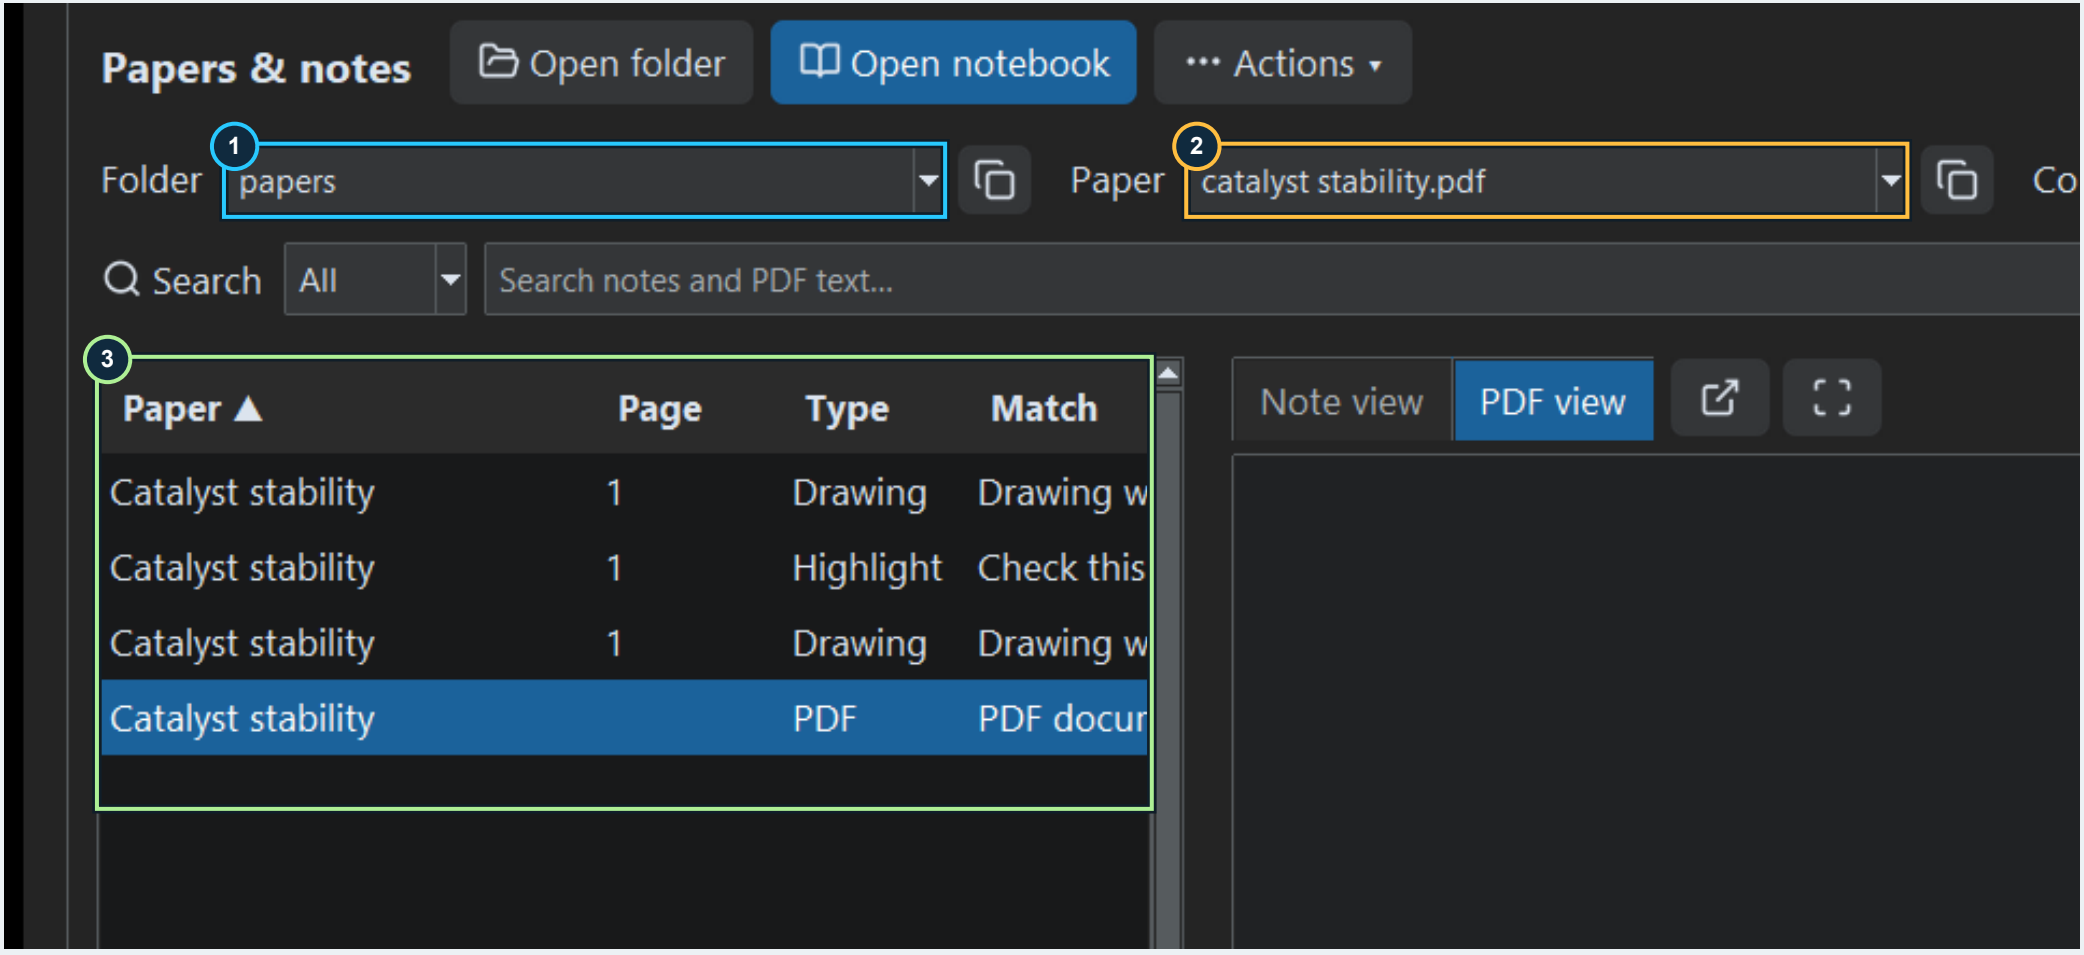

1. Select a paper **2.** Open the paper here

What to expect: Reader opens with the corresponding Folder and Paper selected, its results loaded, and the PDF displayed.

Open a paper in Reader

2. Check Folder and Paper. To see other papers in the folder, choose All papers in the Paper dropdown.

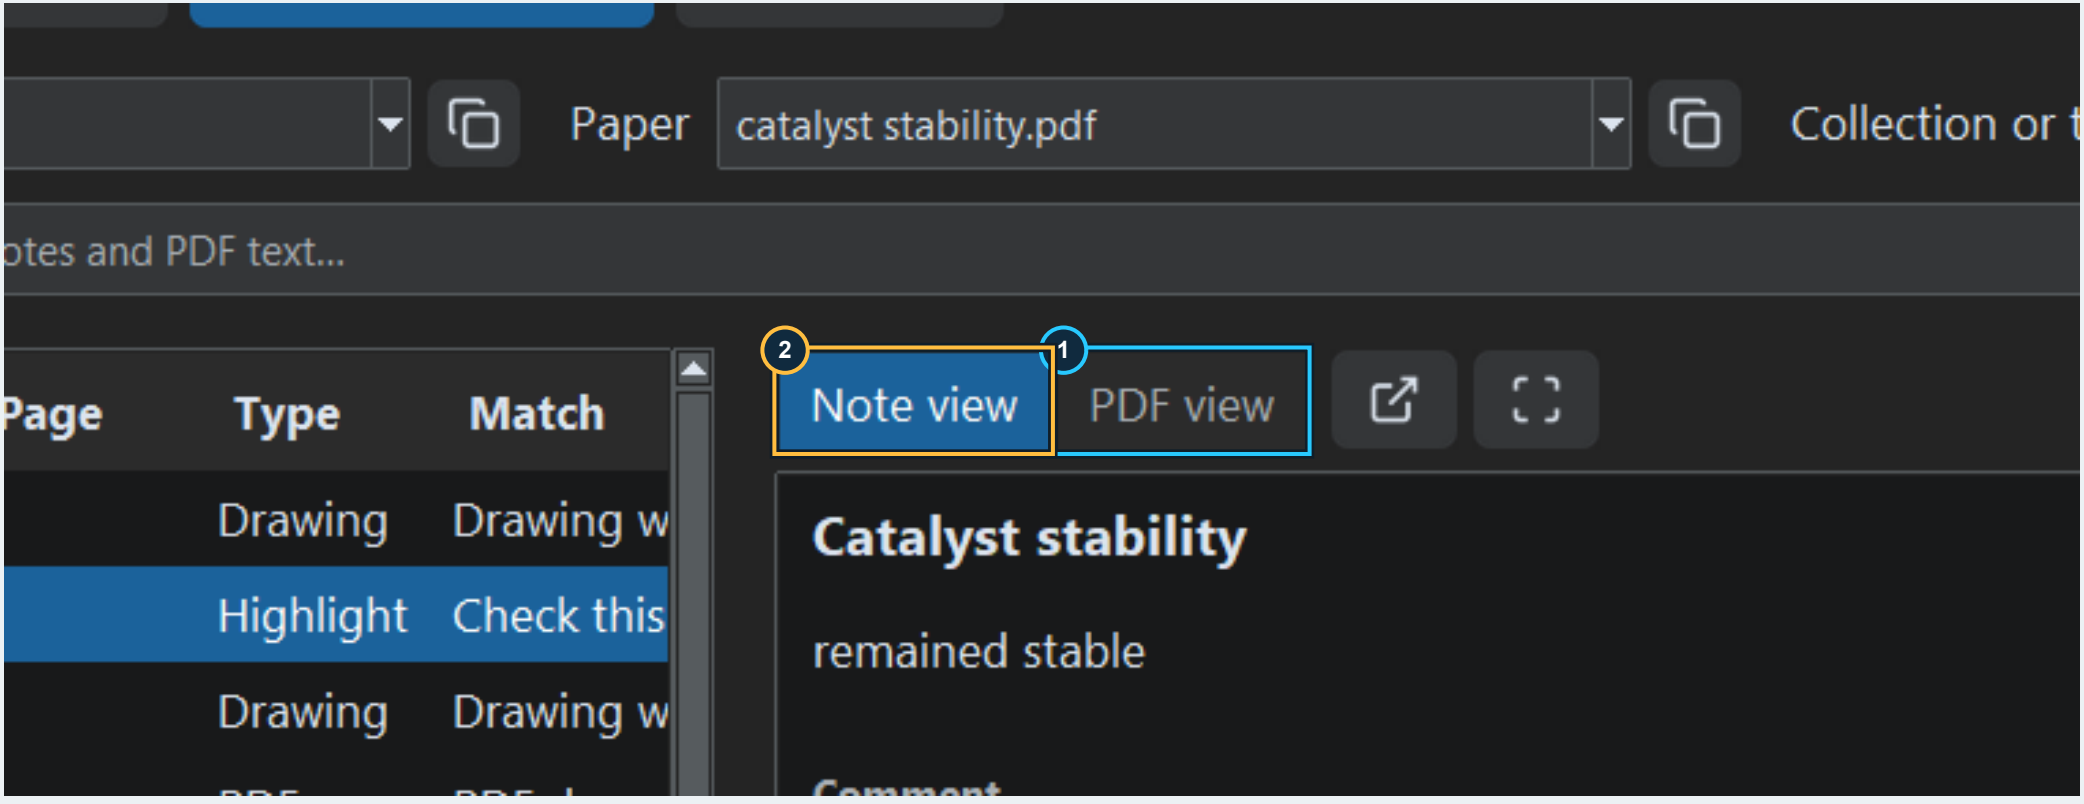

1. Folder scope **2.** One paper or All papers **3.** Results for the current filters

What to expect: The Paper dropdown is a filter: selecting one paper intentionally narrows the left list to that paper. Folder, collection/tag and search filters also remain in effect.

Read a PDF and return to a selected result

1. Click PDF view to read the complete document rather than the extracted note.

Start here: Select a result in Reader, then use PDF view. Page numbers refer to physical PDF pages.

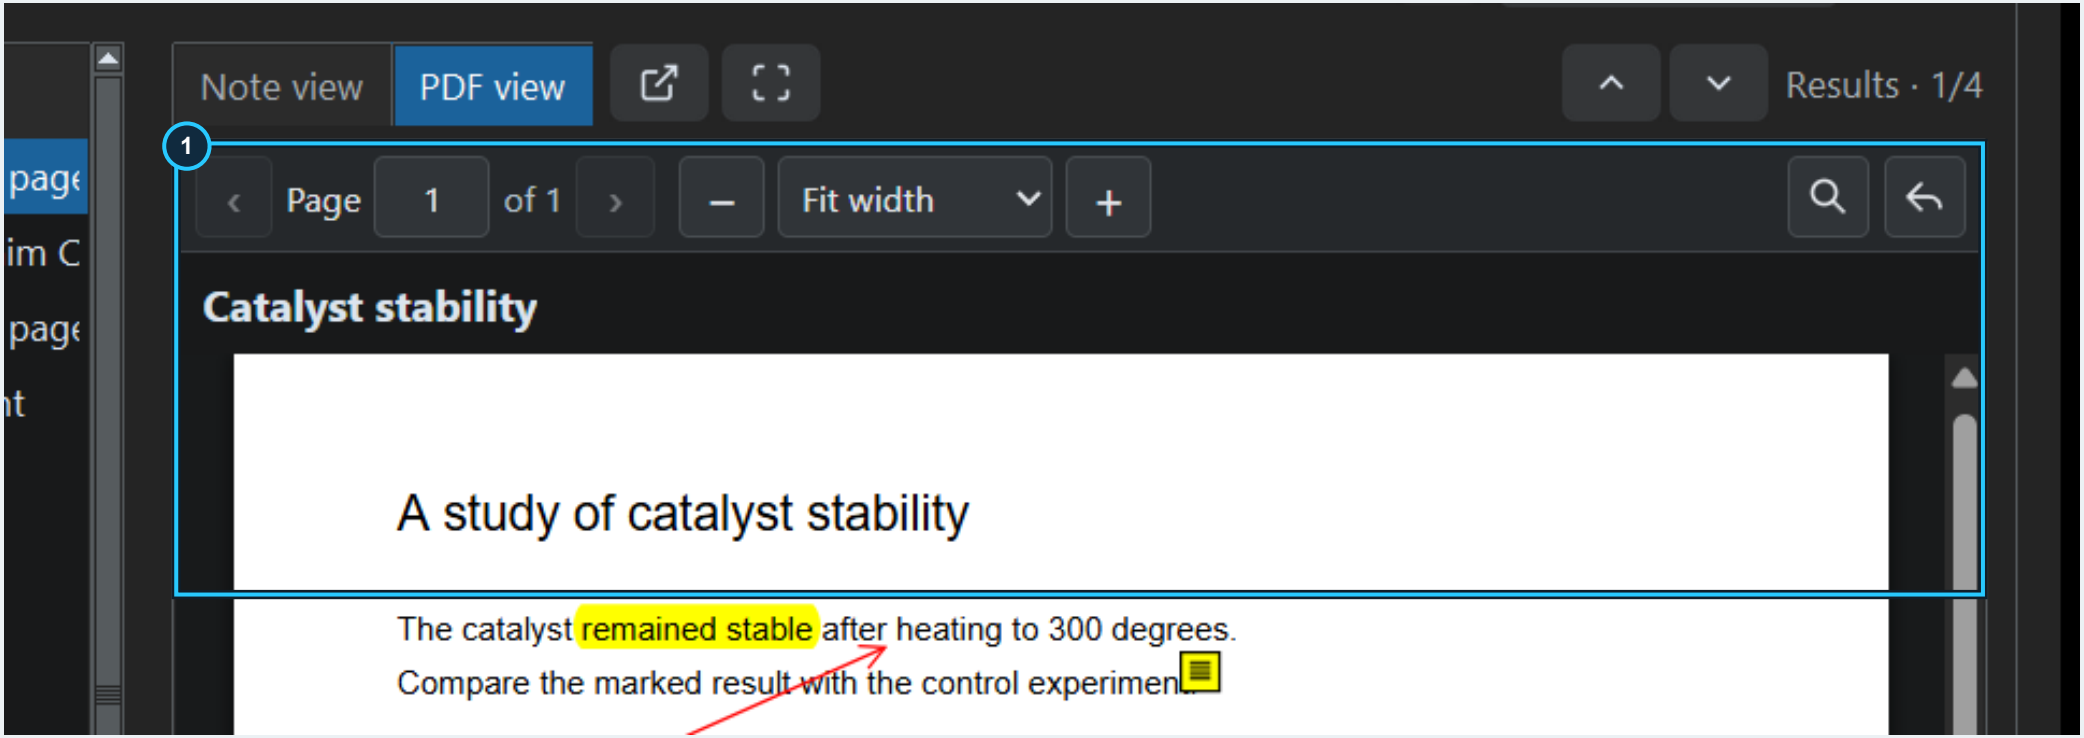

1. Show the complete PDF **2.** Return to extracted notes

What to expect: The PDF opens at the selected result's page. Switching between Note view and PDF view retains your selection and PDF reading position.

Read a PDF and return to a selected result

2. Scroll in the PDF, use the page controls to change page, and leave the zoom at Fit width for a page-width view. Use Back to selection after browsing away.

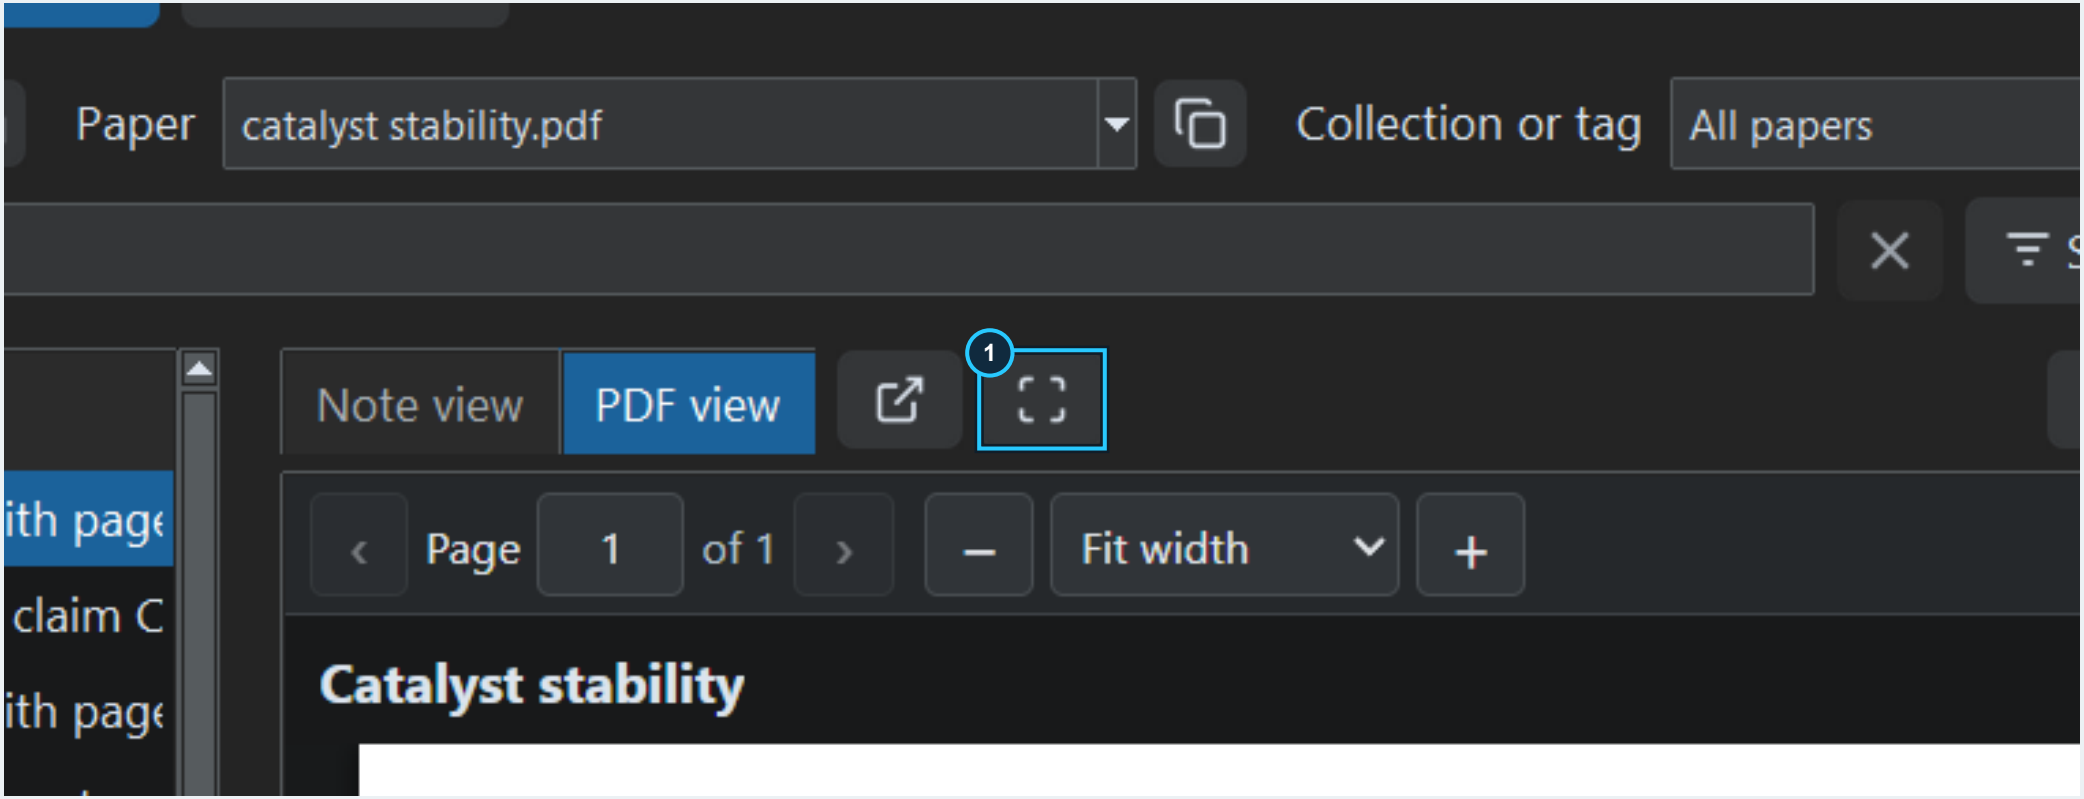

1. Page, zoom and return controls are inside this viewer

What to expect: Back to selection returns to the selected note or search hit. Match navigation uses Fit width normally and keeps the page centered horizontally.

Use Reading mode and zoom

1. Click Reading mode beside the view tabs.

Start here: Reading mode gives the PDF more room by hiding the Reader filters and left result list.

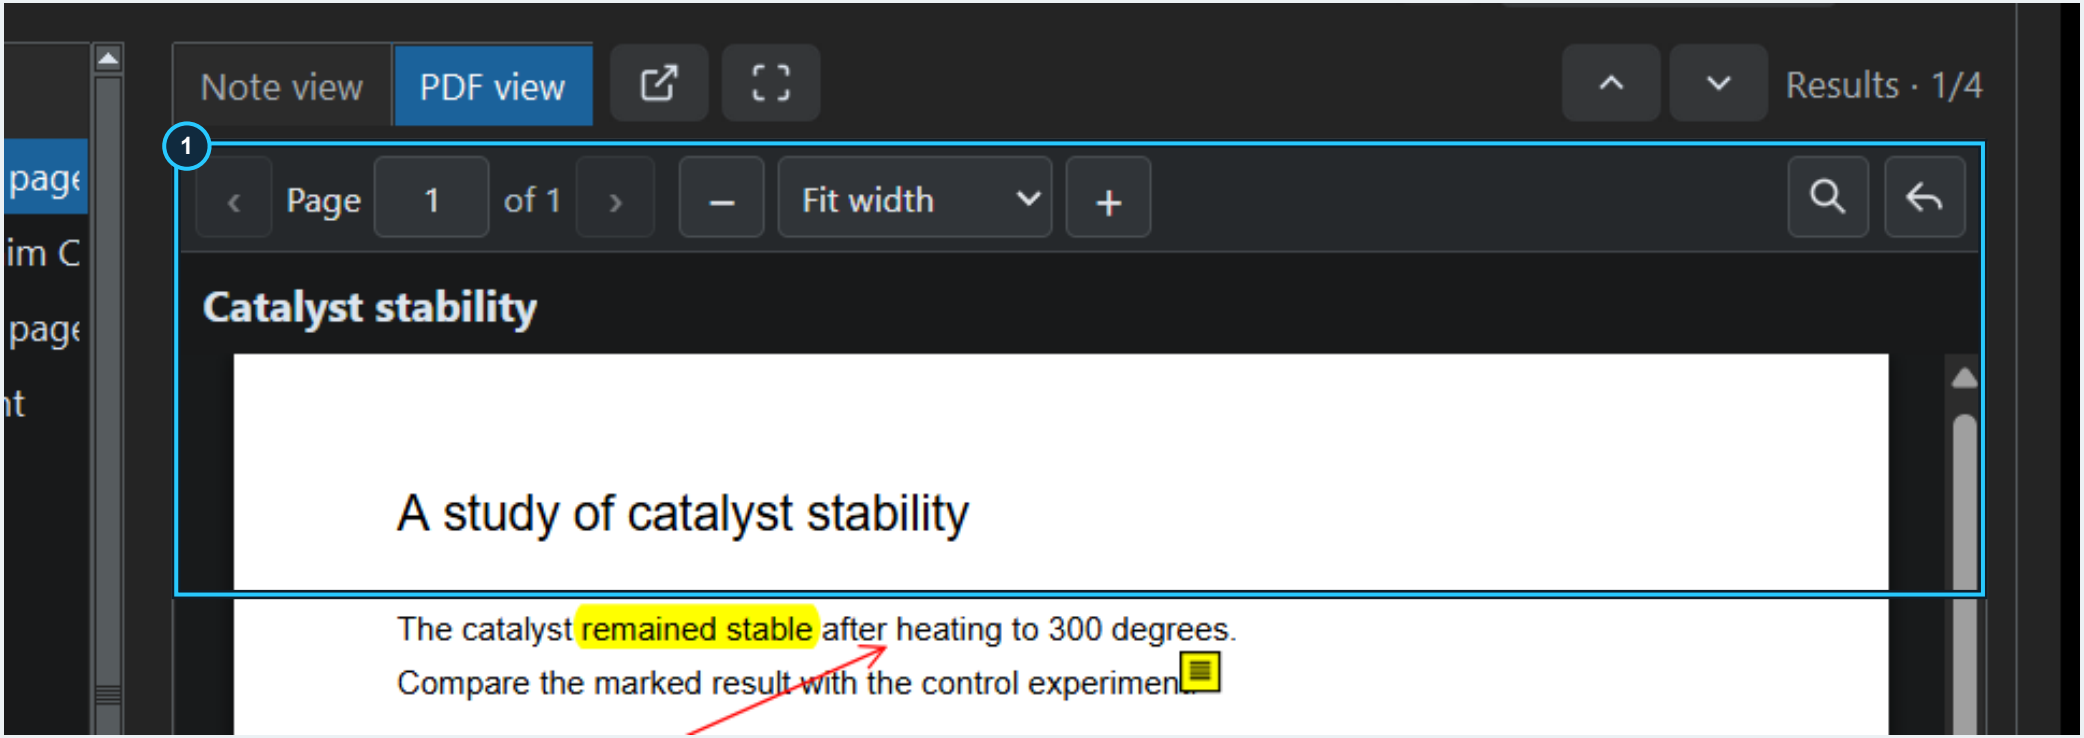

1. Expand the PDF reading area

What to expect: The PDF expands and starts at 125%. Main-match and PDF-Find navigation use 125% while Reading mode is active.

Use Reading mode and zoom

2. Inside the PDF, hold Ctrl and turn the mouse wheel to zoom, or hold Ctrl and drag to pan. Use Ctrl+0 to restore the mode's default zoom. Click Exit reading mode when finished.

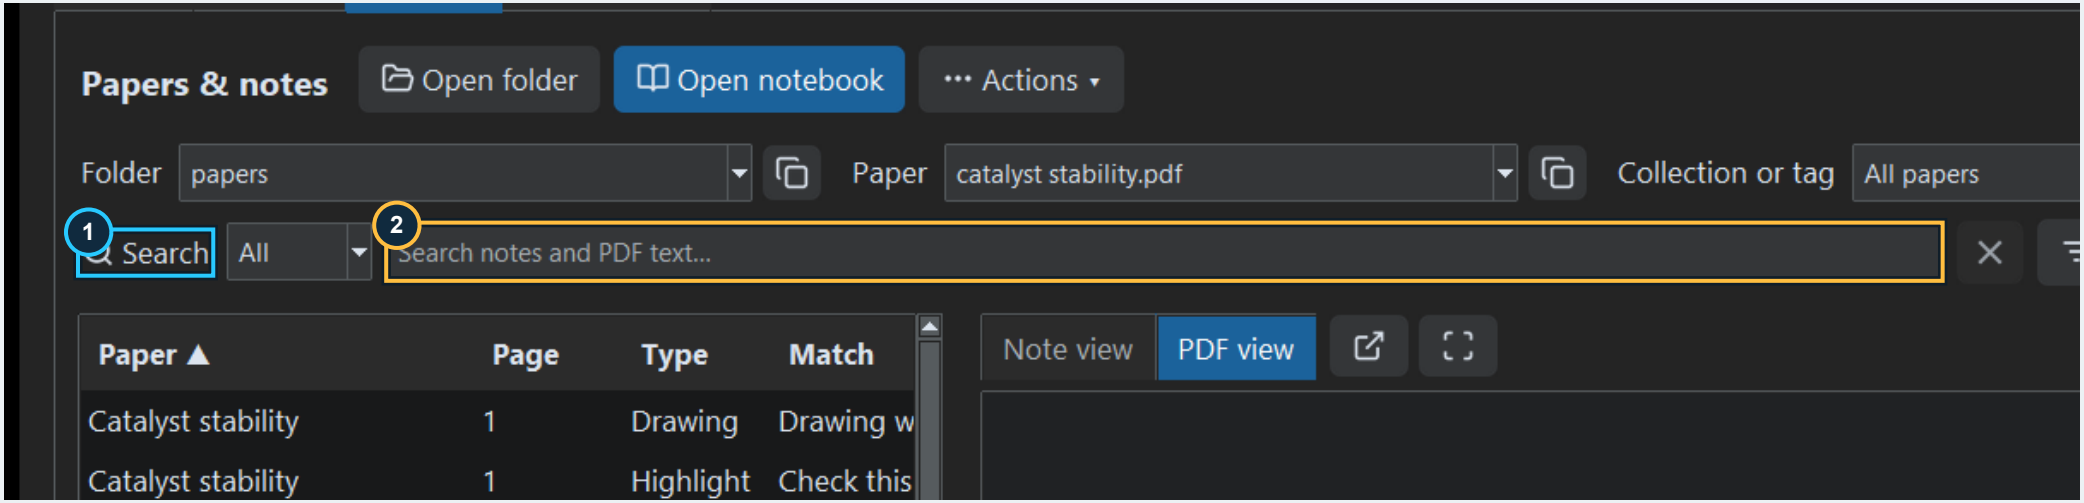

1. Zoom, pan and reset inside the PDF

What to expect: Exiting restores your prior layout, view and zoom while retaining the page you reached. Ctrl+double-click restores the default zoom and the current page's starting position.

Search across notes and PDFs

1. Choose Notes, PDFs or All in the dropdown immediately beside Search, then type a word or phrase in the search field.

Start here: Choose Folder, Paper and Collection or tag first. All folders searches across watched folders.

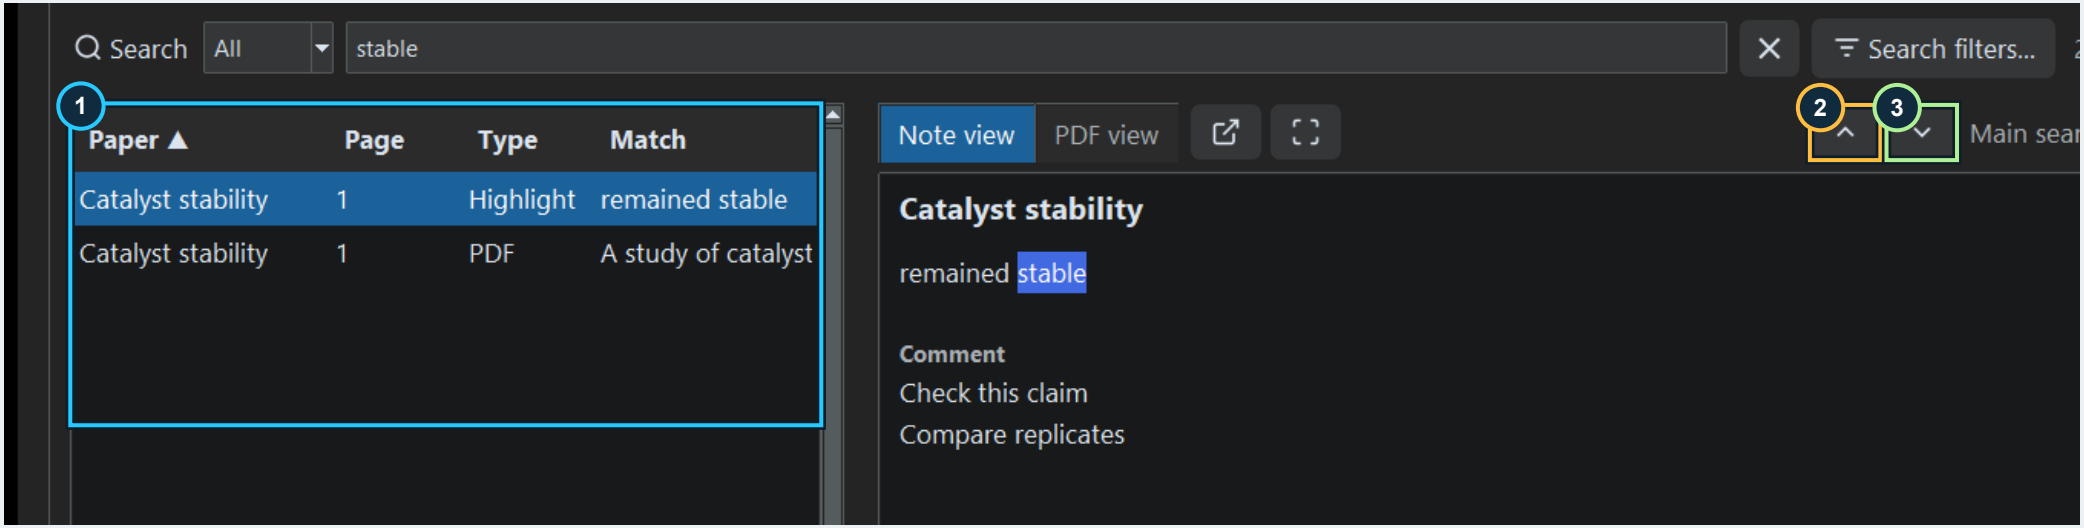

1. Scope selector is immediately beside this label **2.** Enter the main search

What to expect: Notes searches saved annotation fields. PDFs searches printed page text and paper information. All includes both. An empty query browses documents and notes without indexing PDF text.

Search across notes and PDFs

2. Click a result to inspect it, then use Previous match and Next match to visit each actual occurrence, including results in other papers.

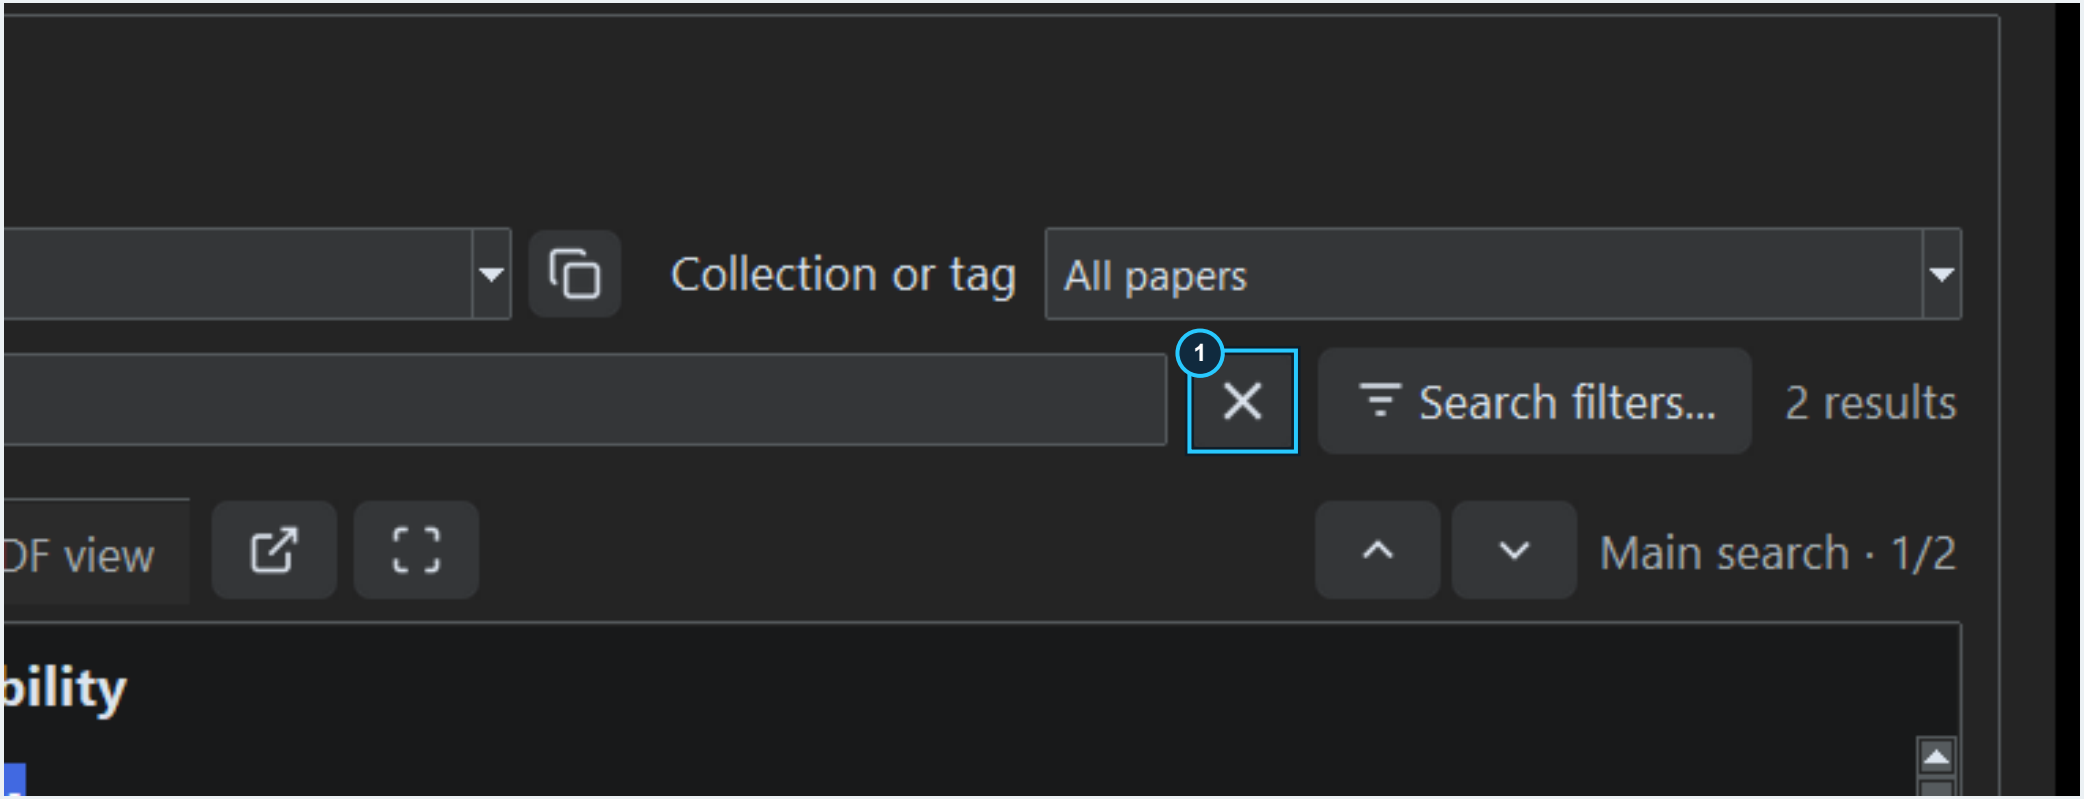

1. Choose a result **2.** Previous main-search occurrence **3.** Next main-search occurrence

What to expect: Main search uses blue marks and its own counter. Same-PDF navigation reuses the displayed document; changing papers retains the previous view until the replacement is ready.

Search across notes and PDFs

3. Click Clear search (the X beside the field), or press Escape while typing there.

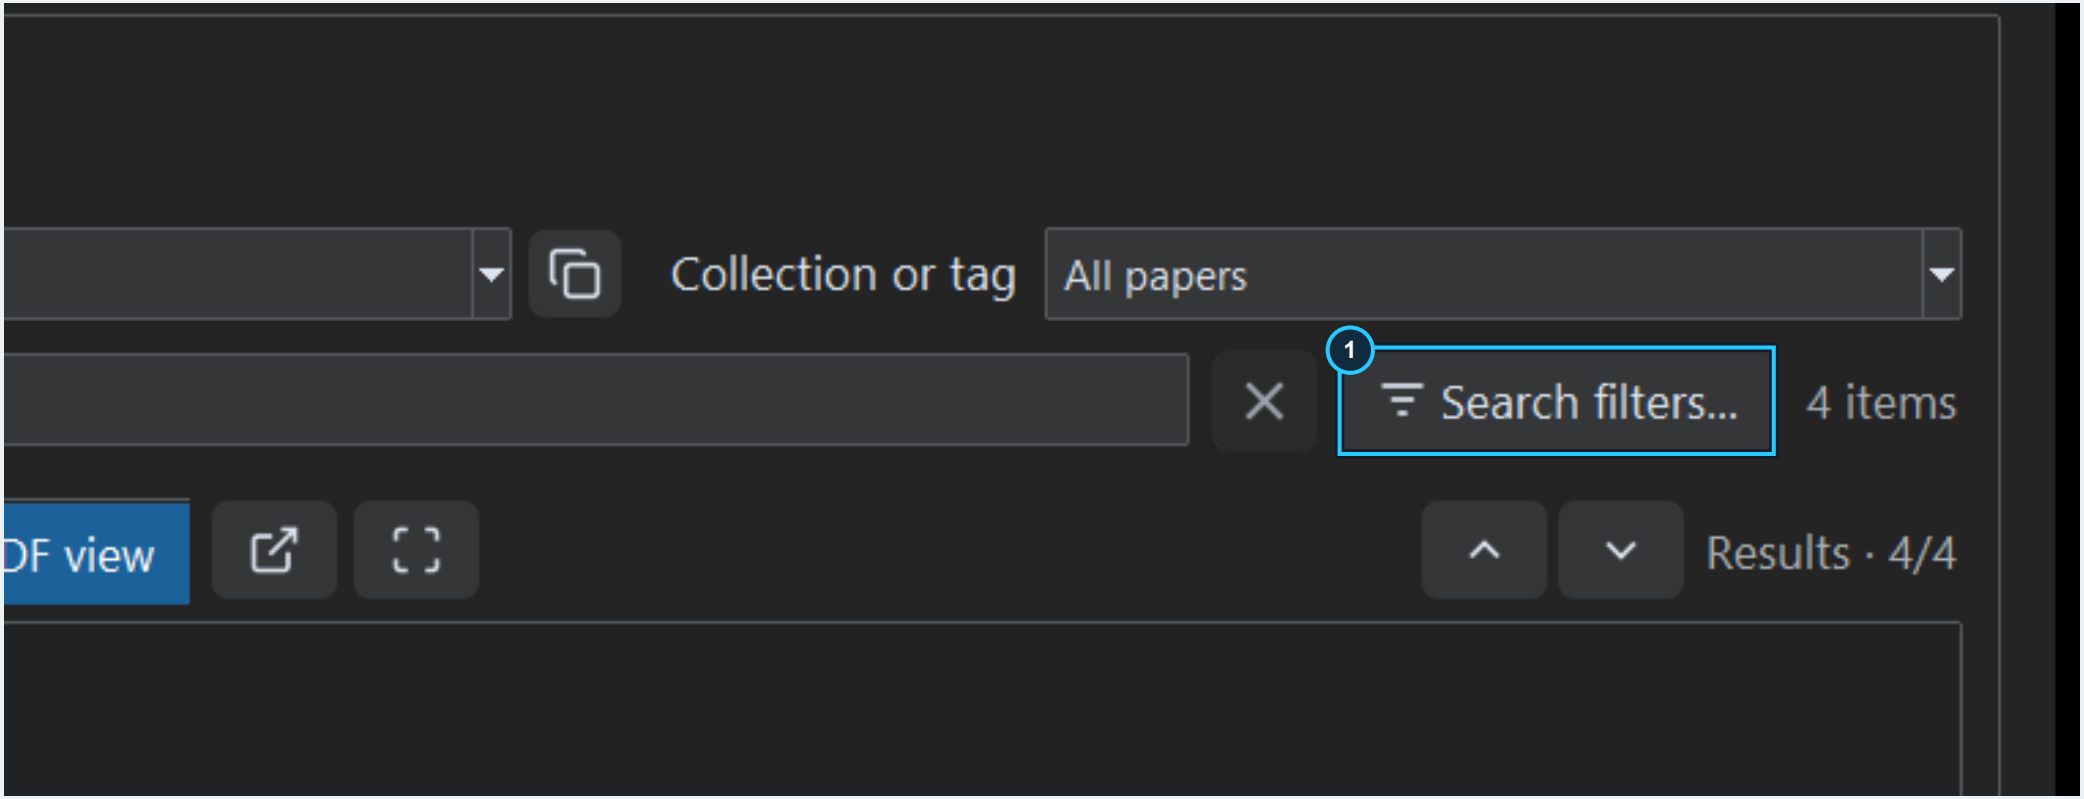

1. Restore browsing without resetting filters

What to expect: Only the query clears. Folder, paper, collection/tag, scope and search options stay in effect.

Choose fields, matching rules and note types

1. Click Search filters… beside the main search field.

Start here: Search filters controls note fields and matching rules. Note-specific controls are disabled in PDFs-only scope.

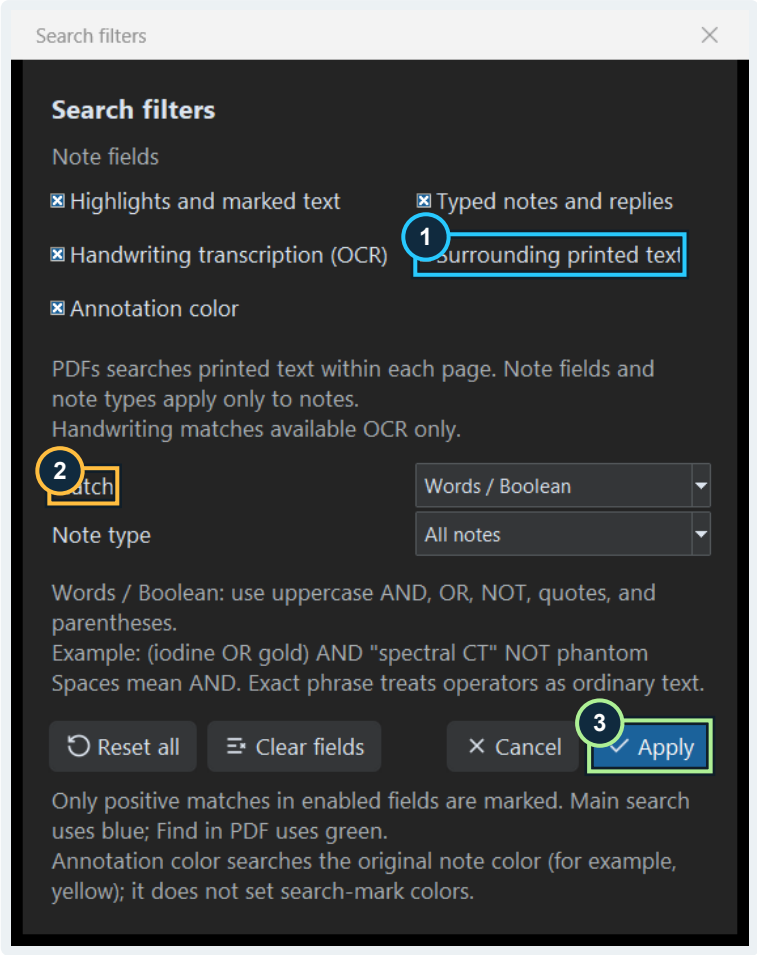

1. Open matching options

What to expect: The options dialog opens with your current choices.

Choose fields, matching rules and note types

2. Choose the note fields, Match rule and Note type, then click Apply. Turn on Surrounding printed text only when you want context near annotations included.

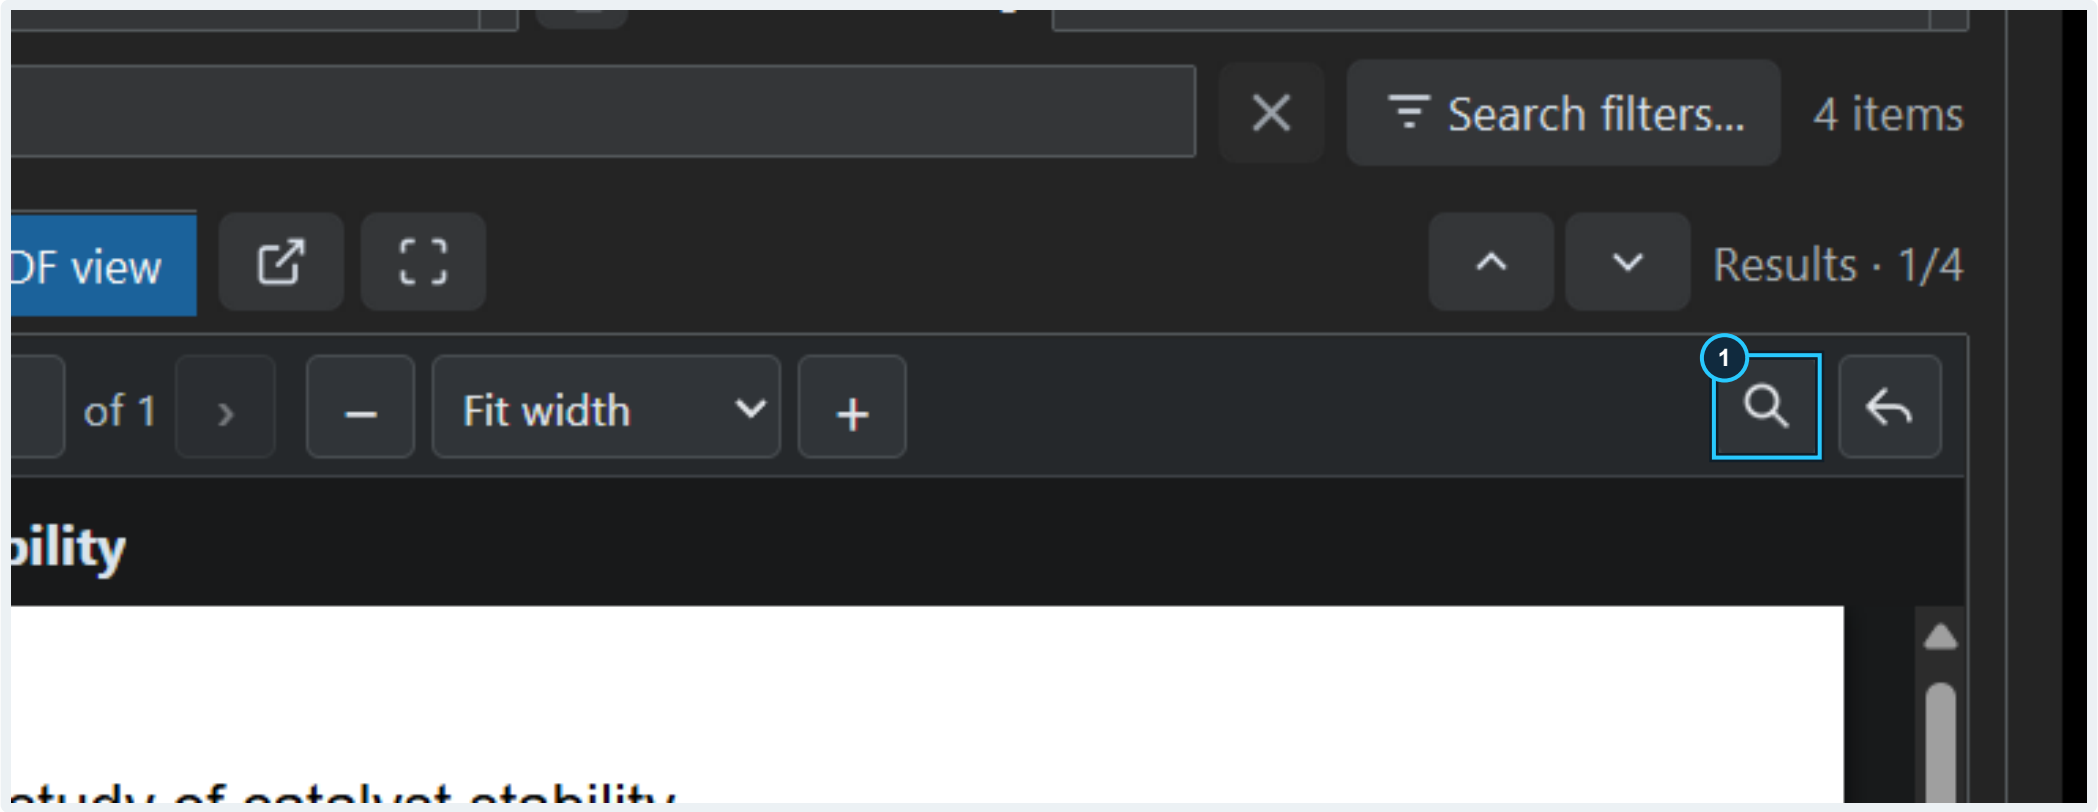

1. Optional context near notes **2.** Boolean words or exact phrase **3.** Apply this draft

What to expect: Words / Boolean supports spaces as AND, uppercase AND/OR/NOT, quoted phrases and parentheses. Exact phrase treats operators literally. Annotation color searches the saved note color; it does not choose a mark color.

Find text only in the open PDF

1. Click the magnifying-glass Find in PDF button inside the PDF toolbar, or press Ctrl+F while focus is inside the PDF.

Start here: This search stays within the current PDF and does not change the main Reader query, filters or result list.

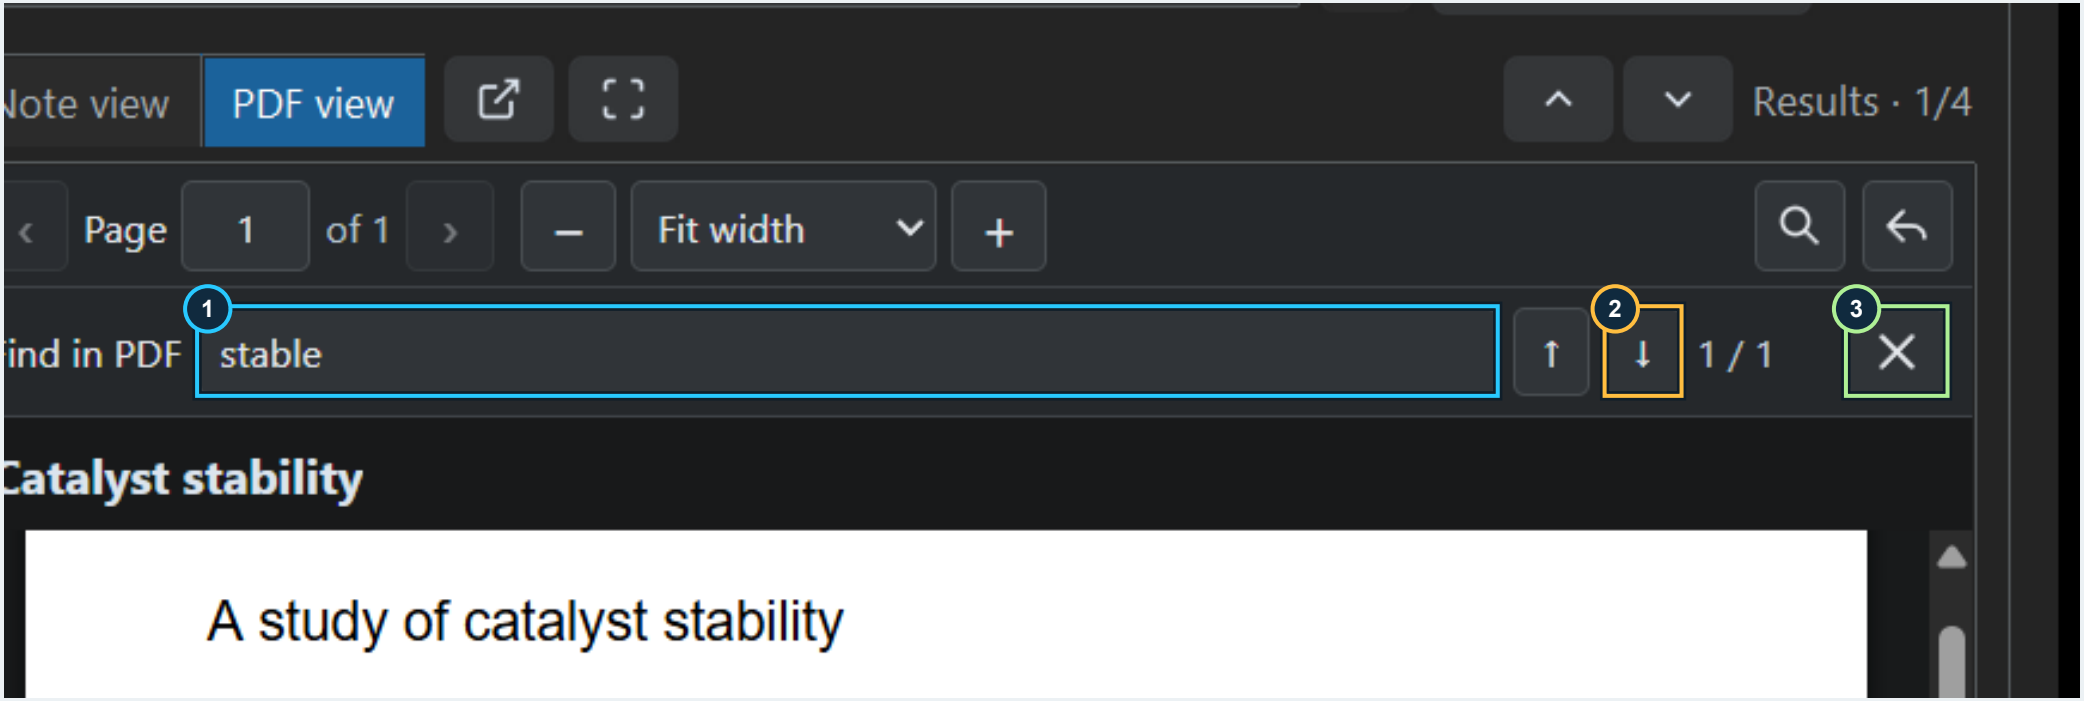

1. Open this PDF's own search

What to expect: A Find in PDF field appears within the viewer. This is separate from the main search field above the result list.

Find text only in the open PDF

2. Type the word or phrase in the PDF’s Find field. Use its up/down arrows, Enter or Shift+Enter to move between occurrences.

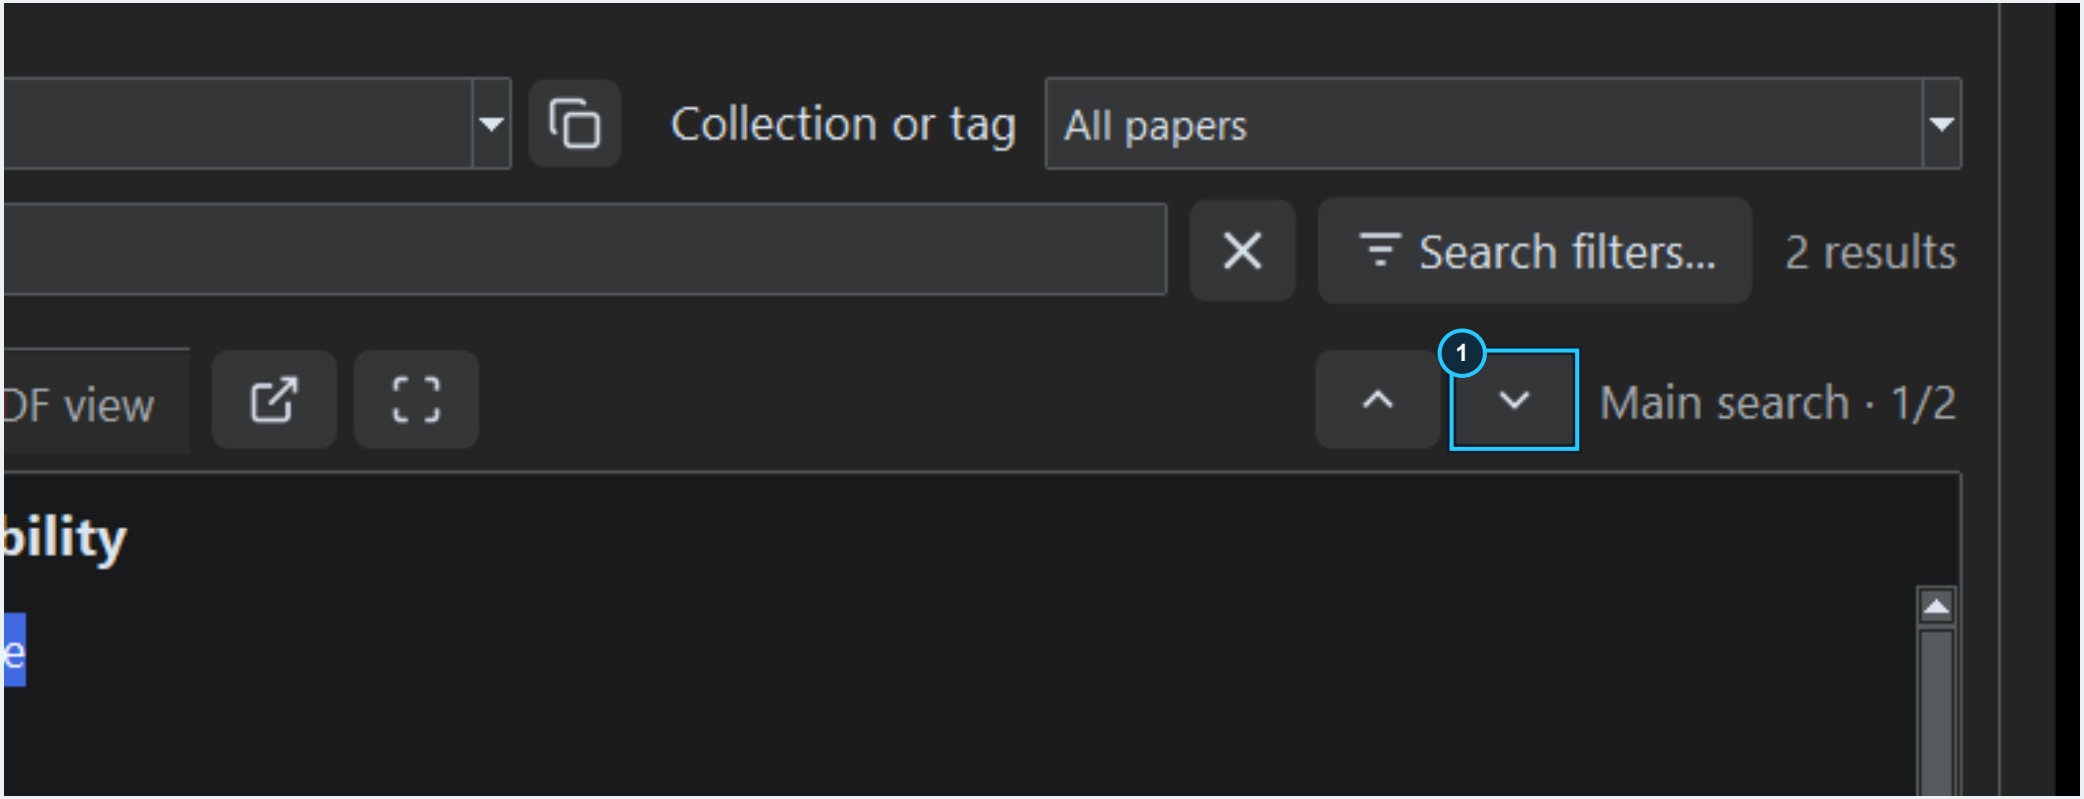

1. Find only in this PDF **2.** Move to the next PDF-only hit **3.** Close PDF Find to resume main search

What to expect: PDF-only hits use green marks. Wrapped terms navigate as one occurrence. Normal navigation retains Fit width; Reading mode uses 125%.

Find text only in the open PDF

3. Close Find with its X or Escape, select a main result, or use the main Previous/Next match controls to resume main search.

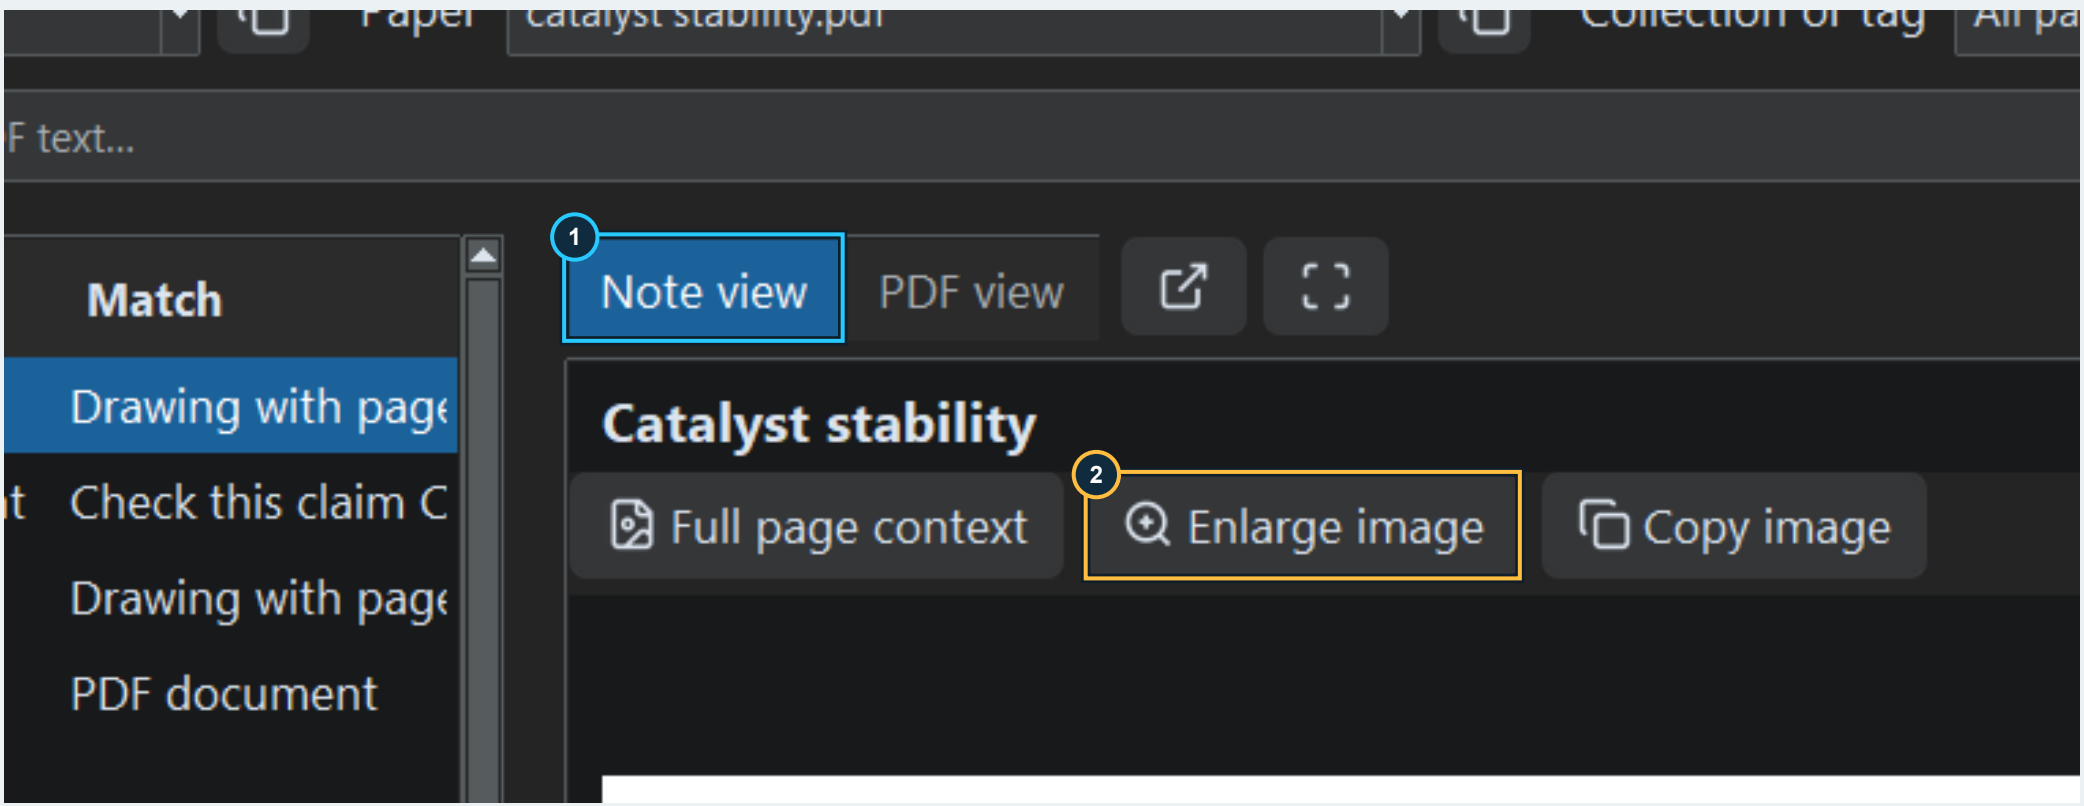

1. Resume main-search navigation

What to expect: Blue main-search marks and the main occurrence counter take over again. The main query and filters have not been replaced by PDF Find.

Inspect handwriting and page context

1. Select a Drawing result and click Note view. Scroll its note preview if needed, then click Enlarge image.

Start here: Drawings and handwriting preserve image context. OCR is optional and may be incomplete.

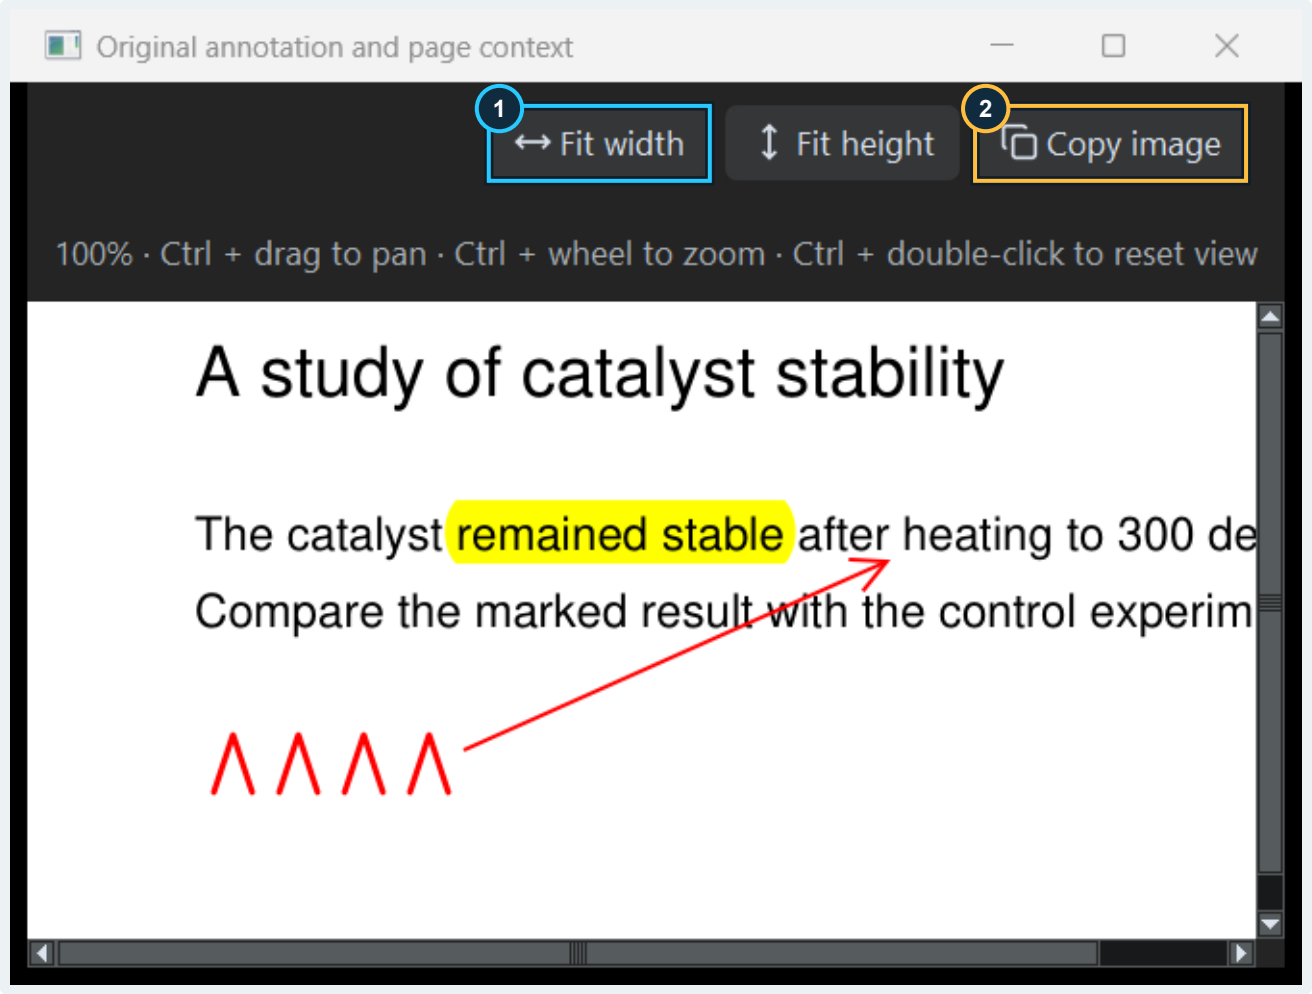

1. Show the drawing close-up **2.** Open the larger image

What to expect: An image window opens for closer inspection. The original drawing pixels remain available.

Inspect handwriting and page context

2. Use Fit width, Fit height, Ctrl+wheel or Ctrl+drag to inspect the drawing. Click Copy image to copy its original pixels.

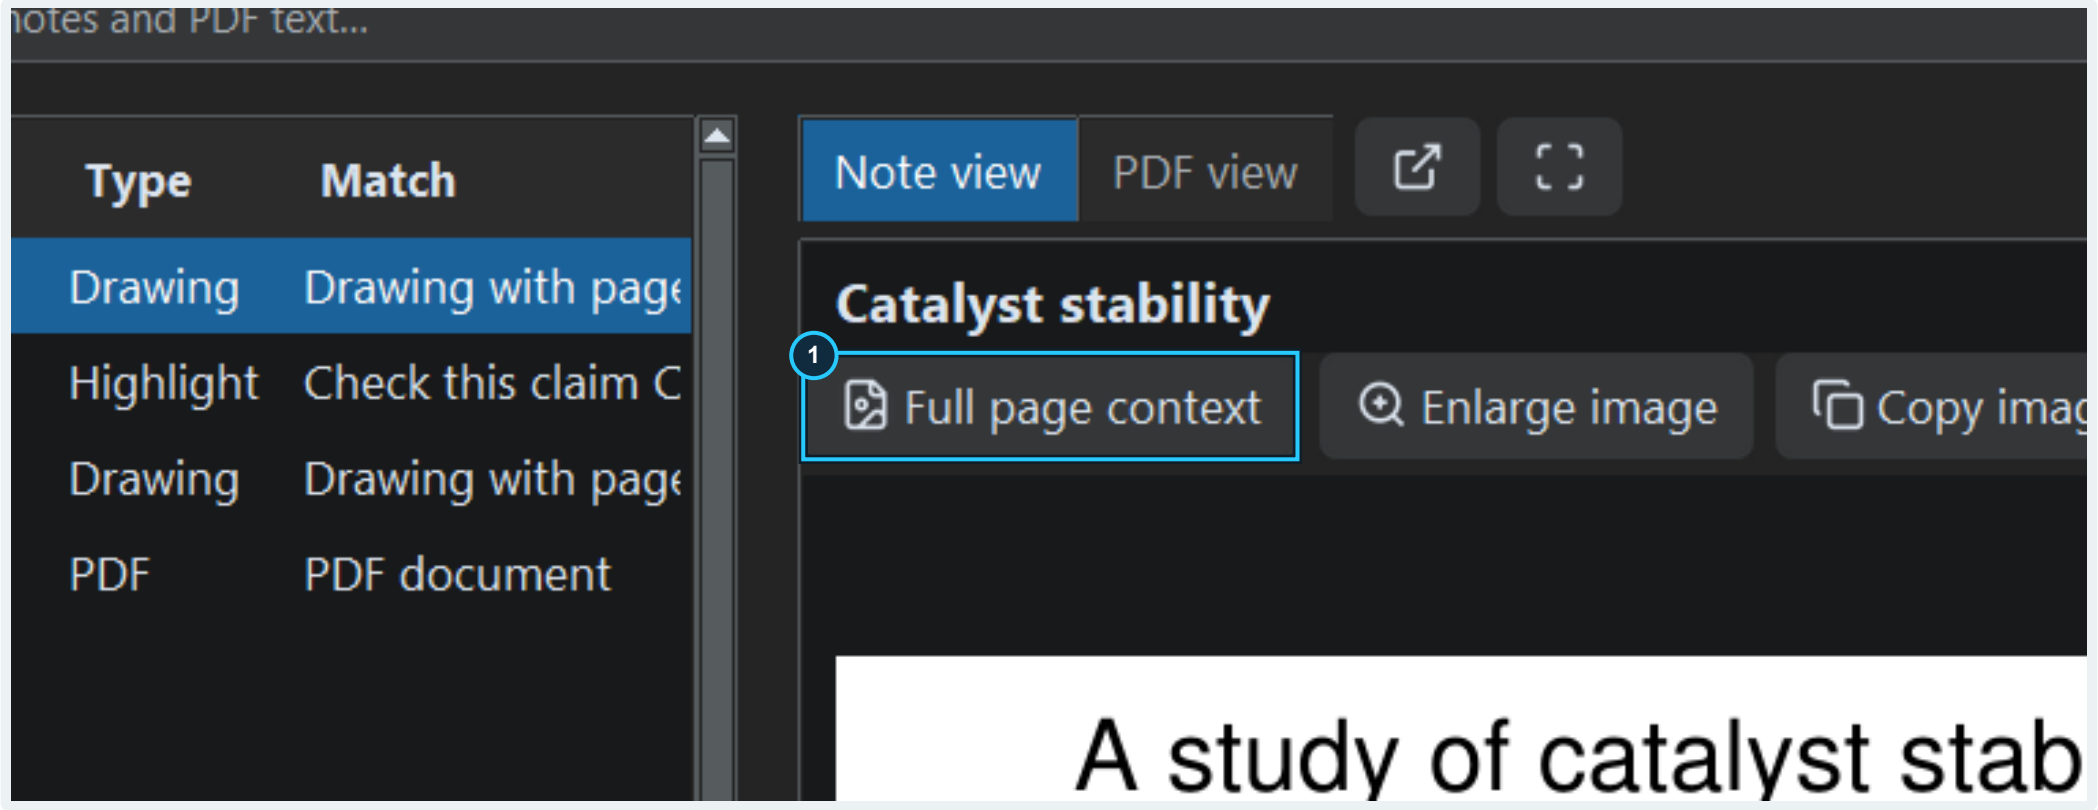

1. Fit the image to the window **2.** Copy original image pixels

What to expect: Copy image places an image on the clipboard for pasting into another app. Ctrl+double-click restores the opening zoom and top-left position.

Inspect handwriting and page context

3. Close the enlarged image and click Full page context.

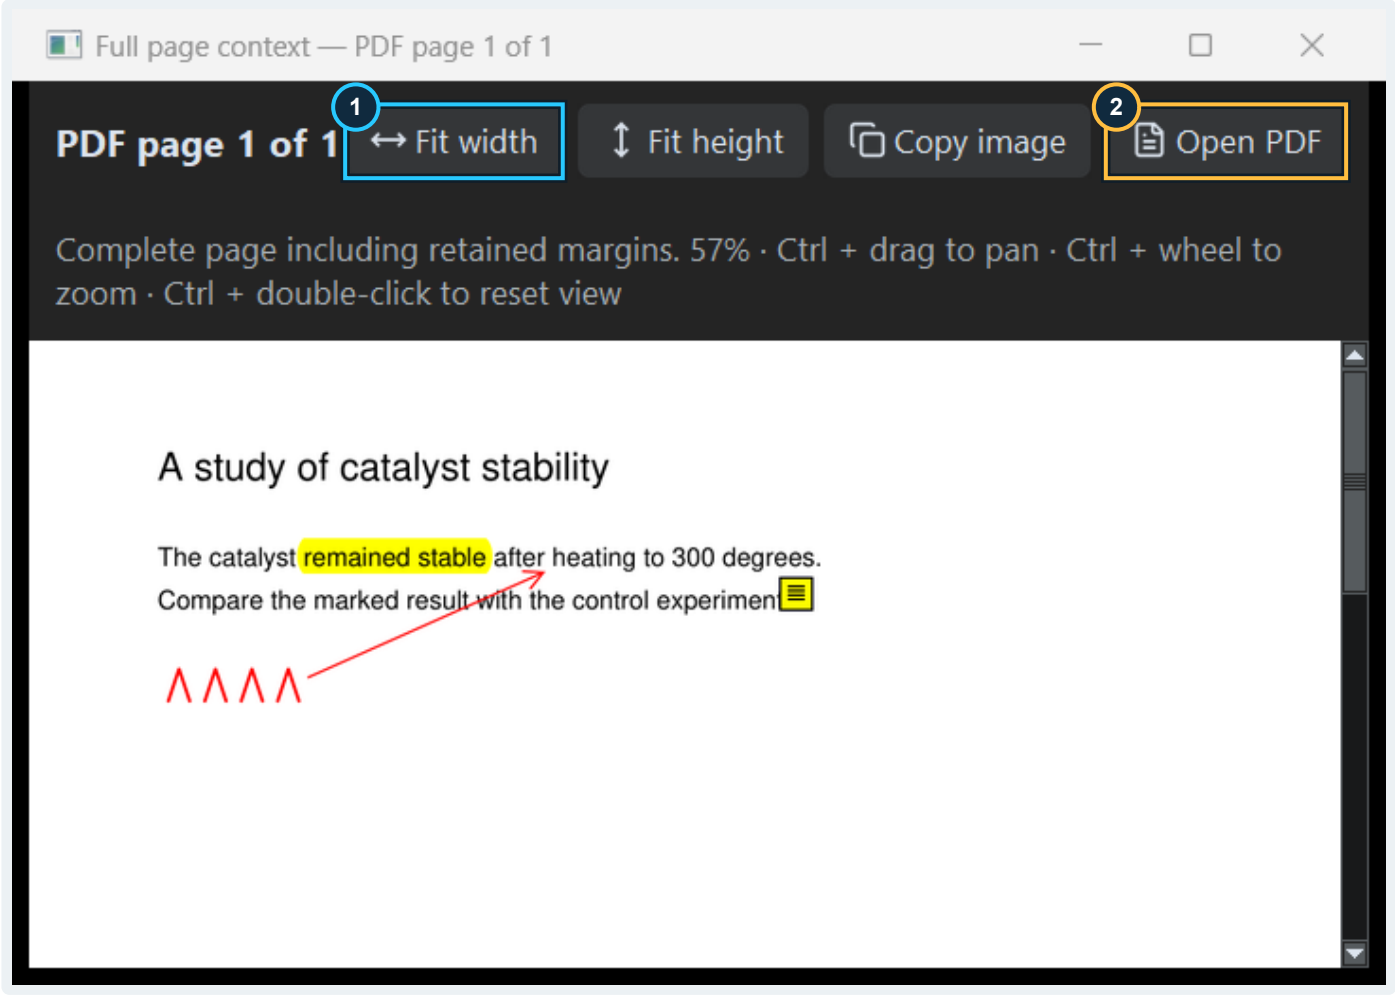

1. Show the whole source page

What to expect: A page-image preview opens so you can inspect nearby printed text and figures; this is separate from the continuous PDF reader.

Inspect handwriting and page context

4. Use the fitting and zoom controls or Copy image. Use Open PDF if you want the source in an external viewer.

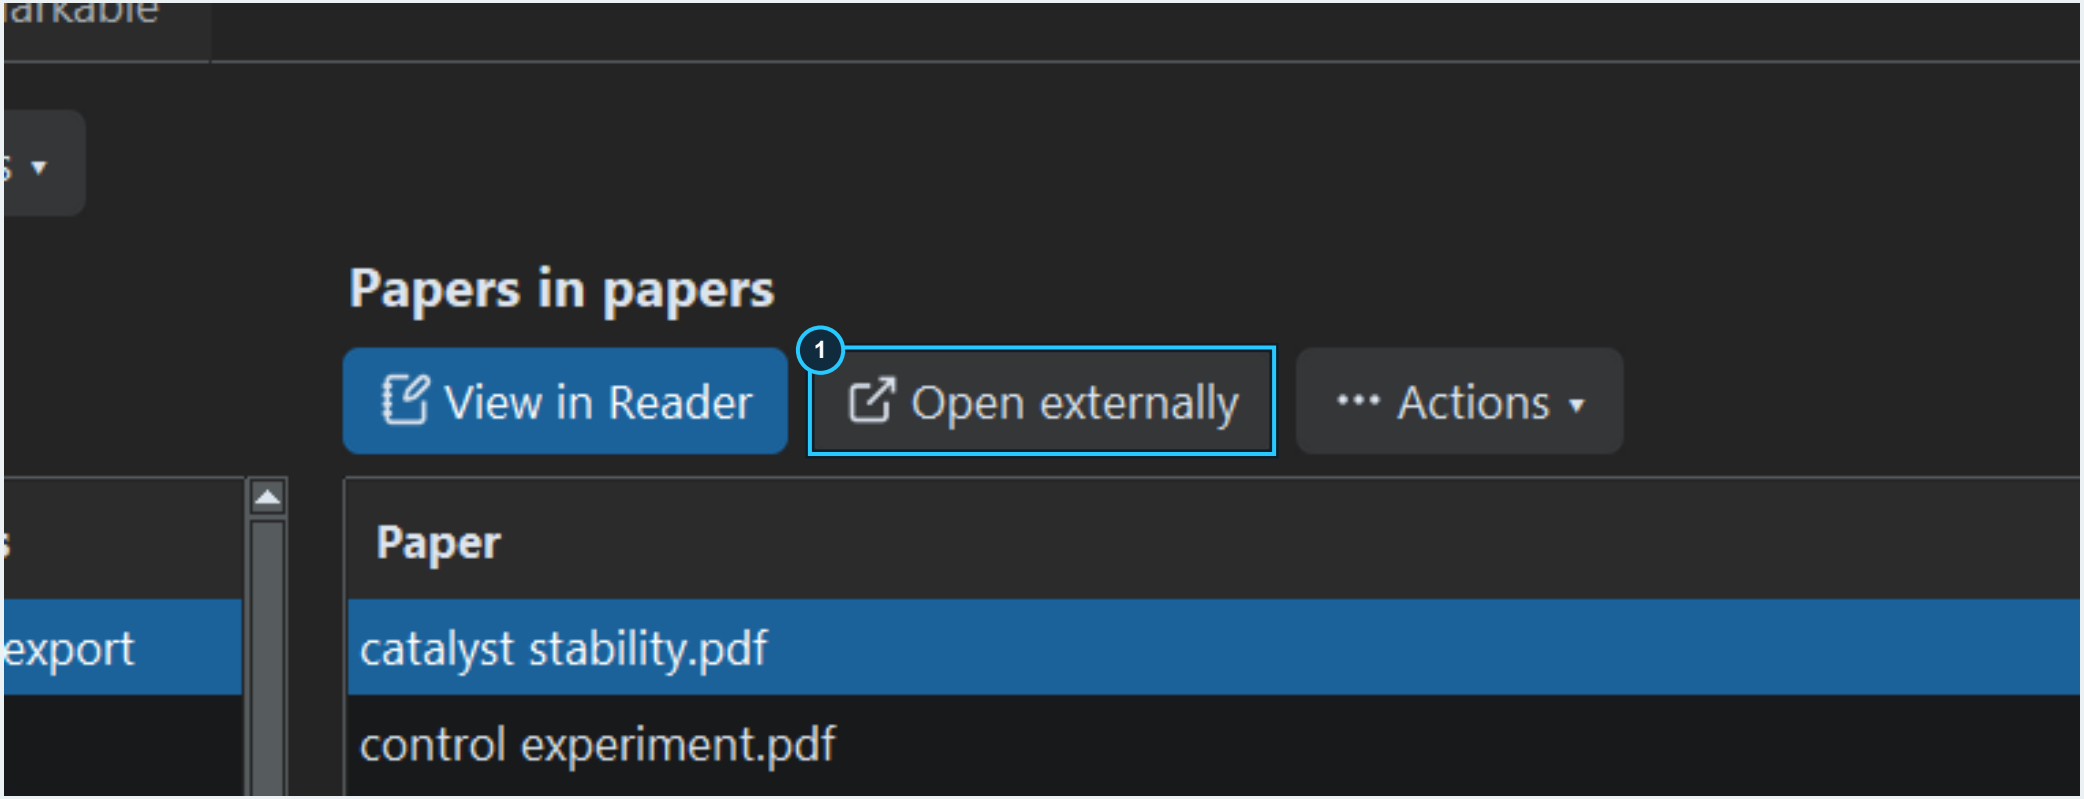

1. Fit this page image **2.** Open the source externally

What to expect: The heading identifies the physical PDF page. External viewers may not honor page-jump requests consistently.

Open a paper externally

1. Select the paper in Library and click Open externally.

Start here: Windows chooses the application associated with .pdf. Reader and Library use that default application.

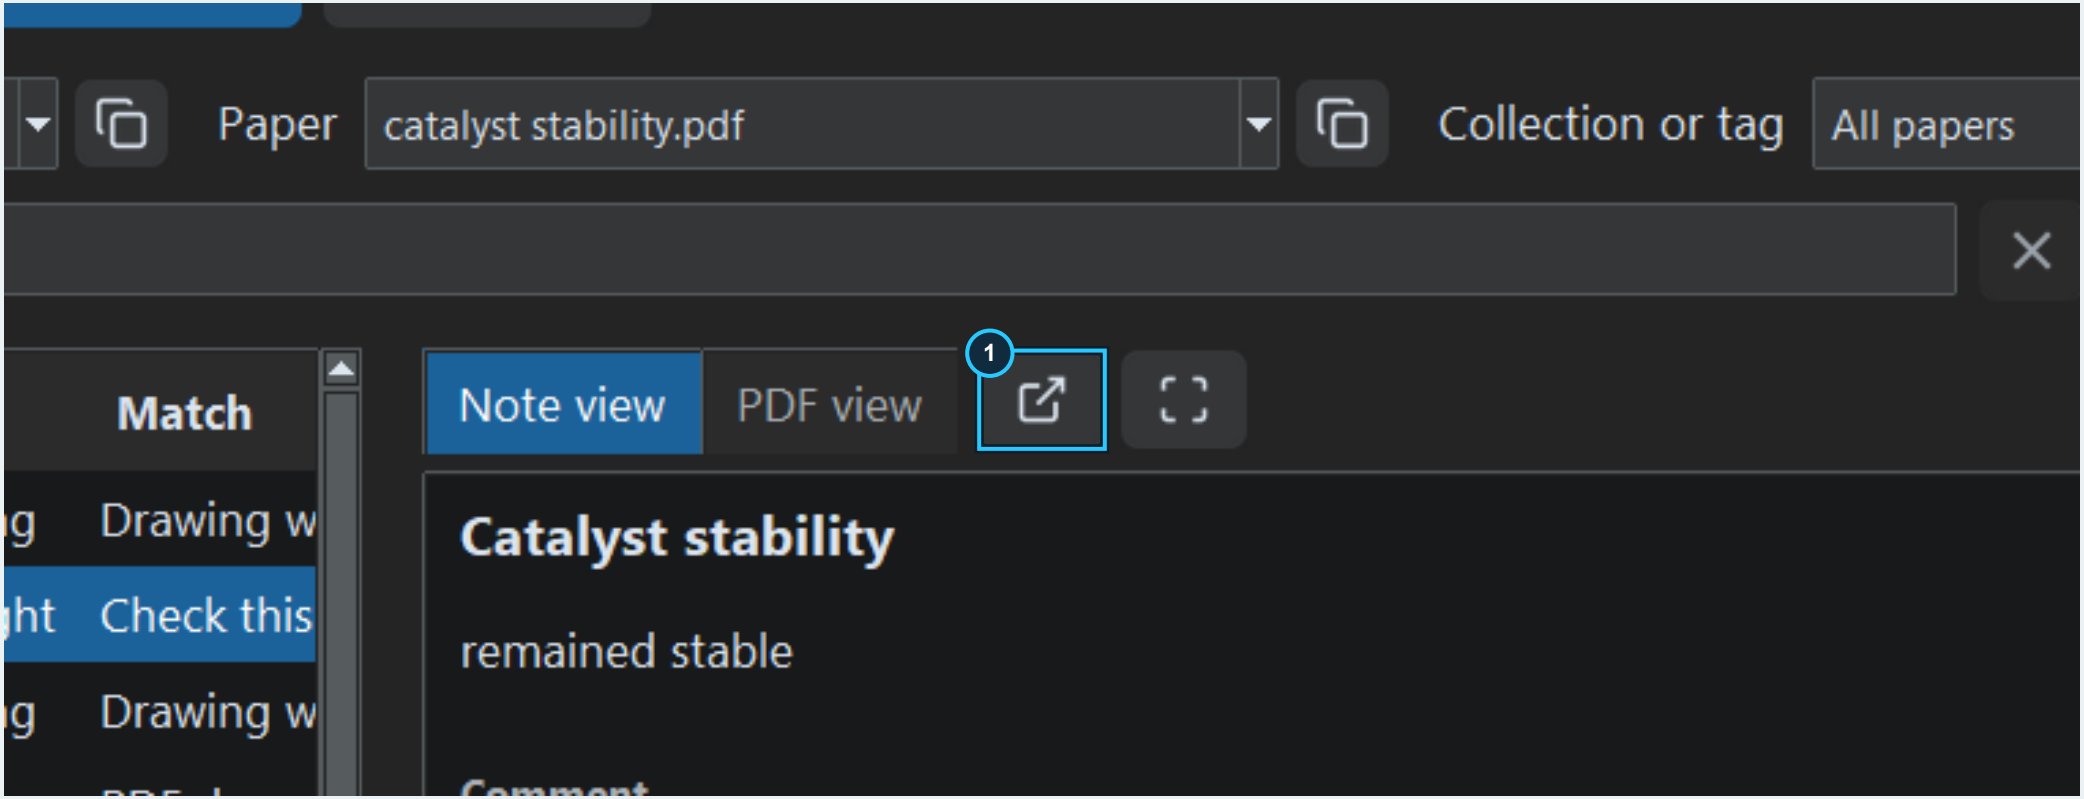

1. Open in your default PDF app

What to expect: Notable prepares a verified combined reading copy when appropriate and launches the Windows default PDF viewer.

Open a paper externally

2. In Reader, use Open externally to open the original source PDF for editing. After saving annotations in the external app, return to Library and click Sync PDFs.

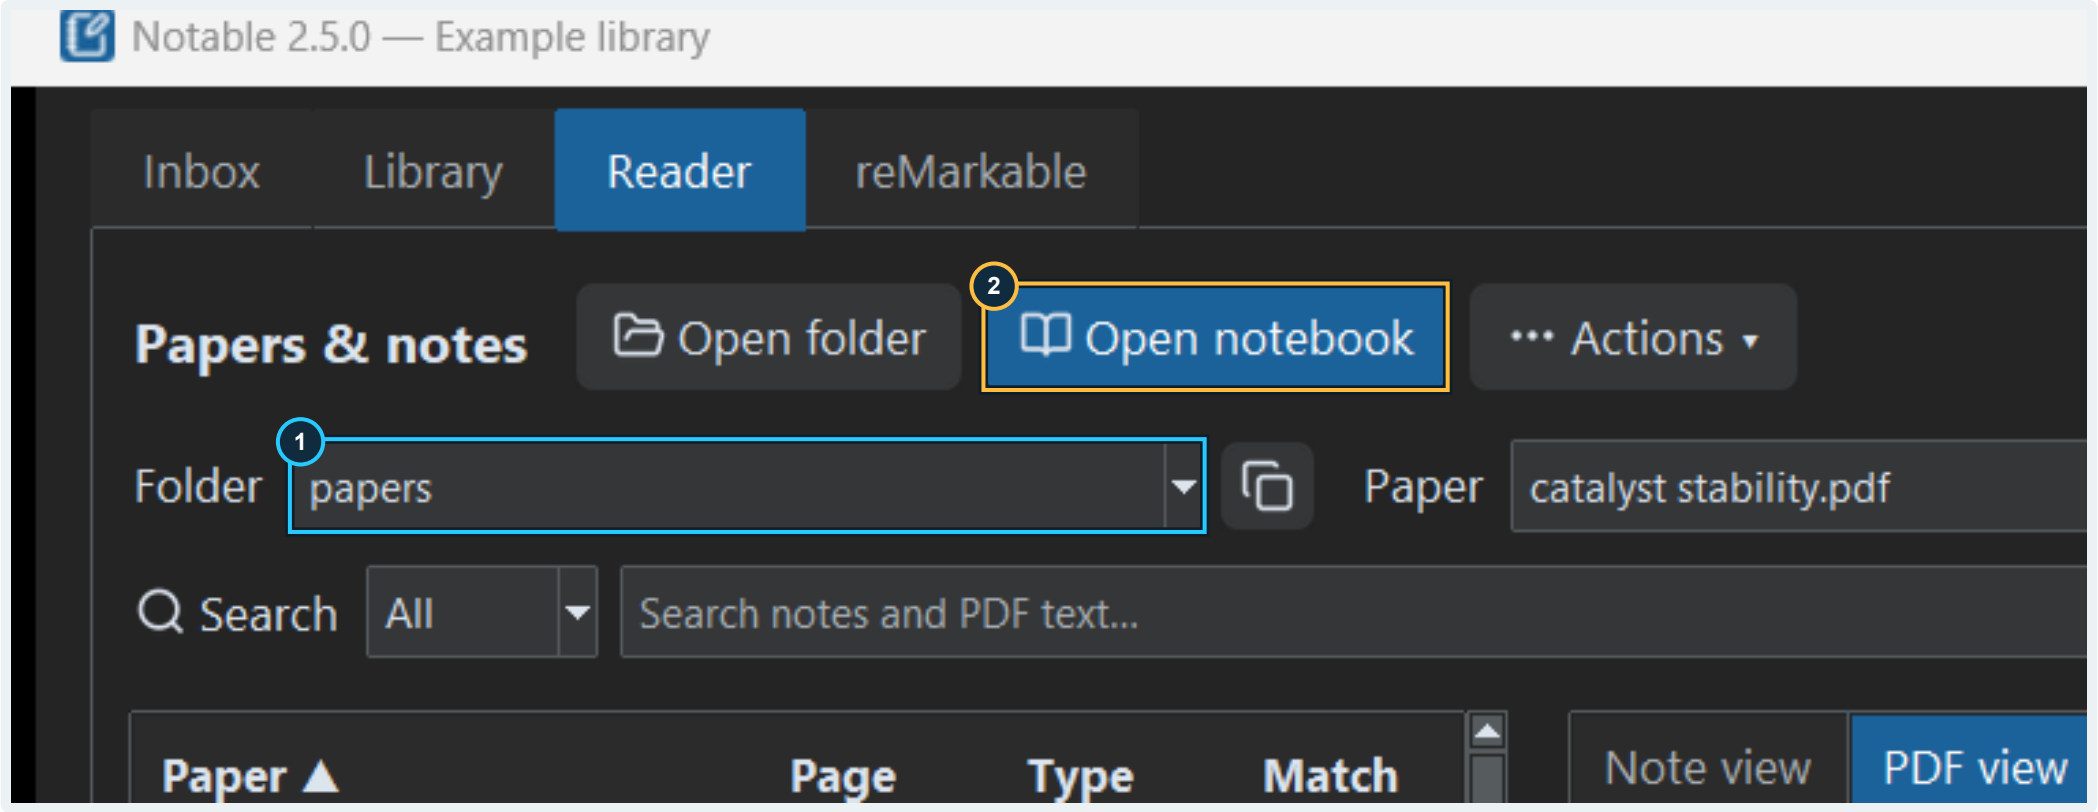

1. Open this result's source PDF

What to expect: New annotations become available after sync. External page jumps depend on the chosen viewer; use Notable's PDF view for consistent internal navigation.

Open or rebuild a generated notebook

1. Choose one Folder, then click Open notebook.

Start here: The generated Word notebook collects saved annotations. Make a separate editable copy for your own writing.

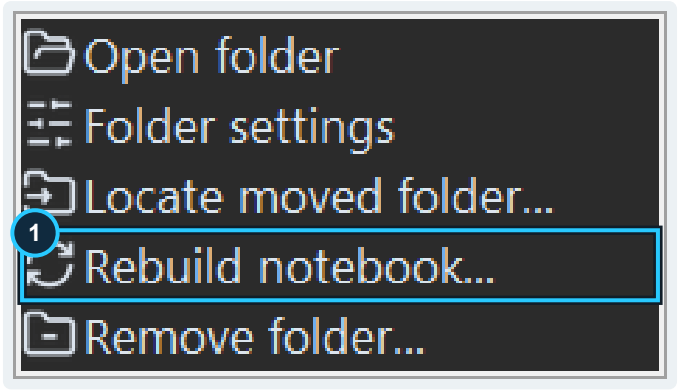

1. Choose one watched folder **2.** Open its generated Word file

What to expect: The generated Notes on <folder>.generated.docx opens in the associated Word app. All folders has no single notebook.

Open or rebuild a generated notebook

2. To regenerate formatting from saved notes, choose Library → Folder actions → Rebuild notebook… and review its confirmation.

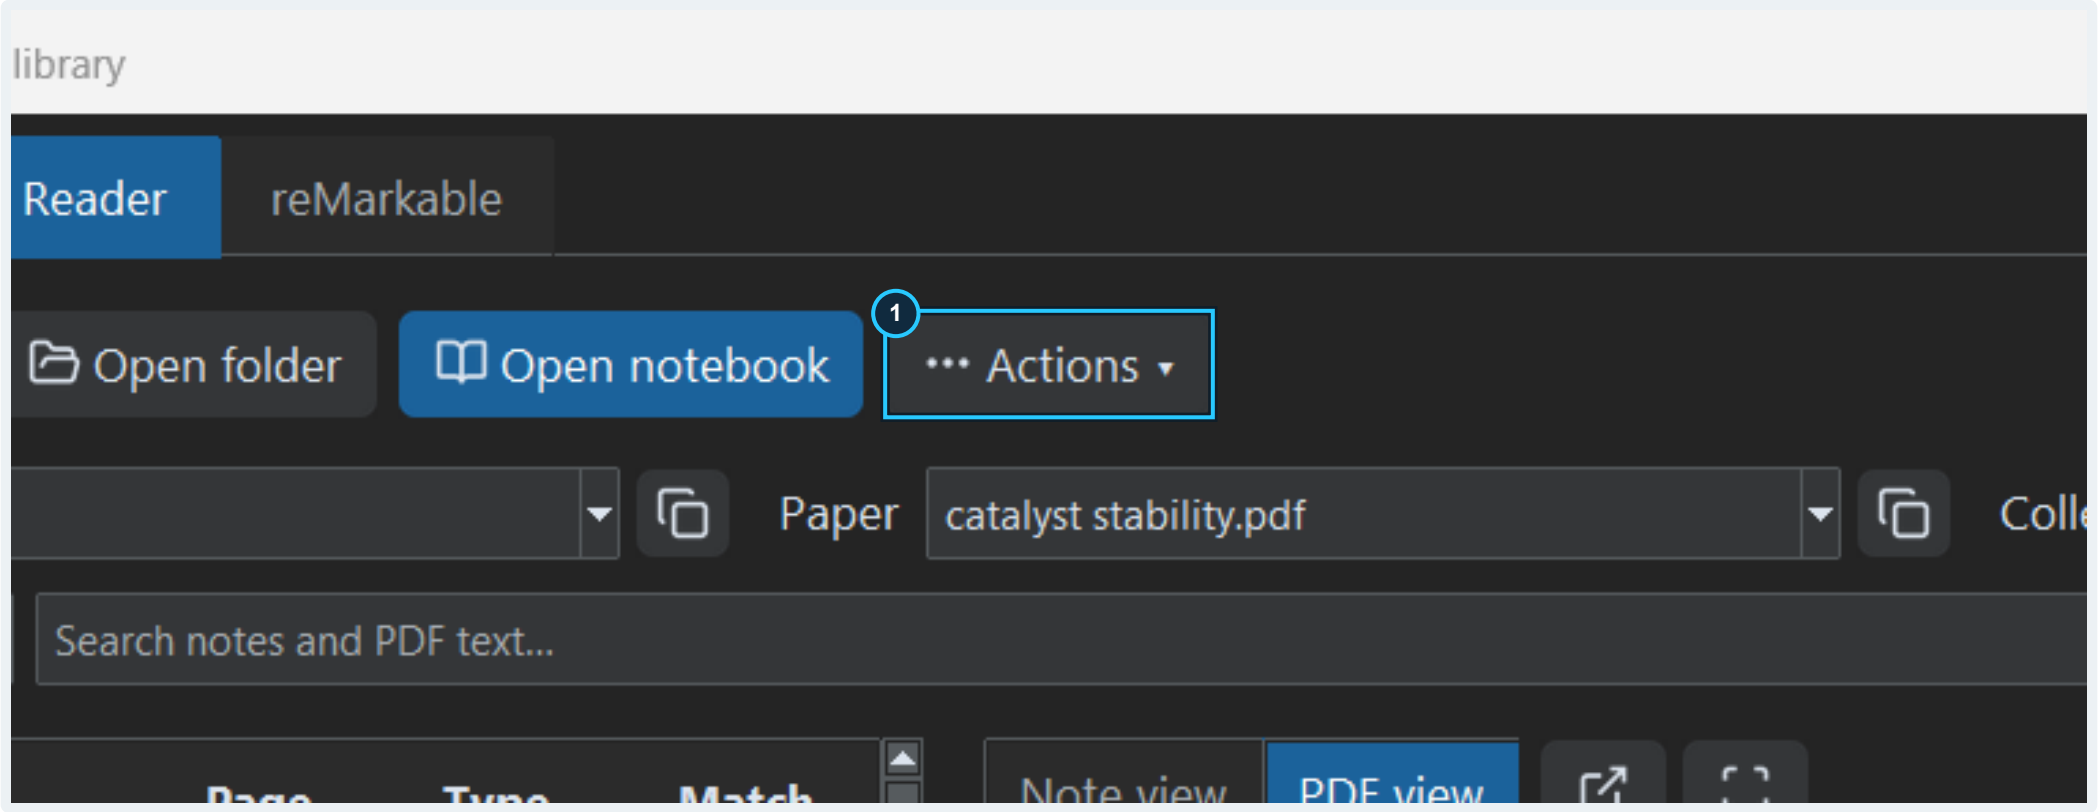

1. Regenerate from saved annotations

What to expect: Rebuild replaces the generated notebook. Previously edited copies are preserved in Notebook backups. Run Sync PDFs first if the underlying saved notes need refreshing.

Save an editable copy or export filtered notes

1. Set the Reader folder, paper and filters as needed, then open Actions □.

Start here: A separate editable copy is yours to write in. Export view uses only the annotations in the current Reader results.

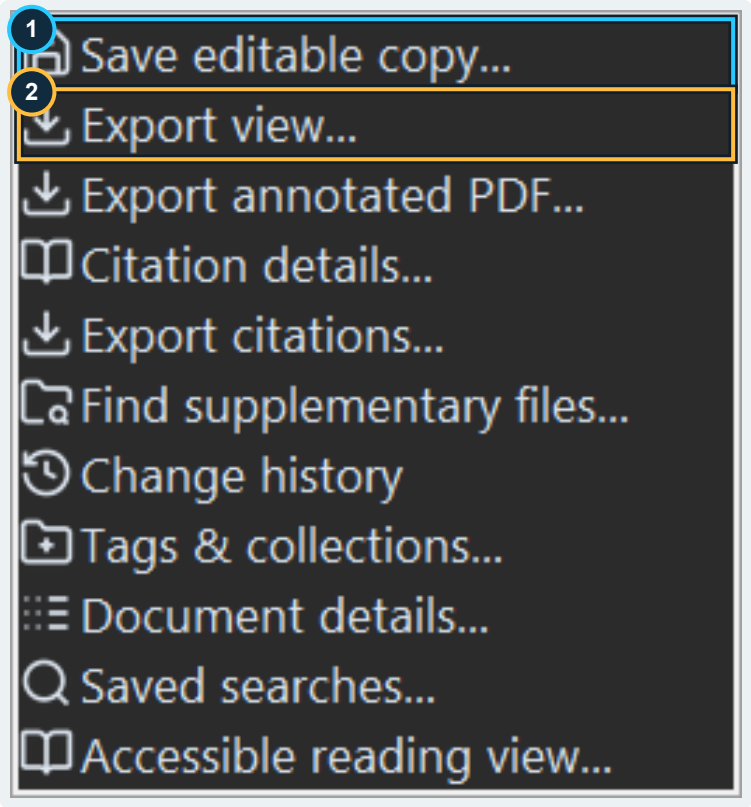

1. Open export actions

What to expect: The Reader action menu includes Word exports and paper tools.

Save an editable copy or export filtered notes

2. Choose Save editable copy… for a separate writing document, or Export view… for the current filtered annotations. Choose a new .docx destination in the save dialog.

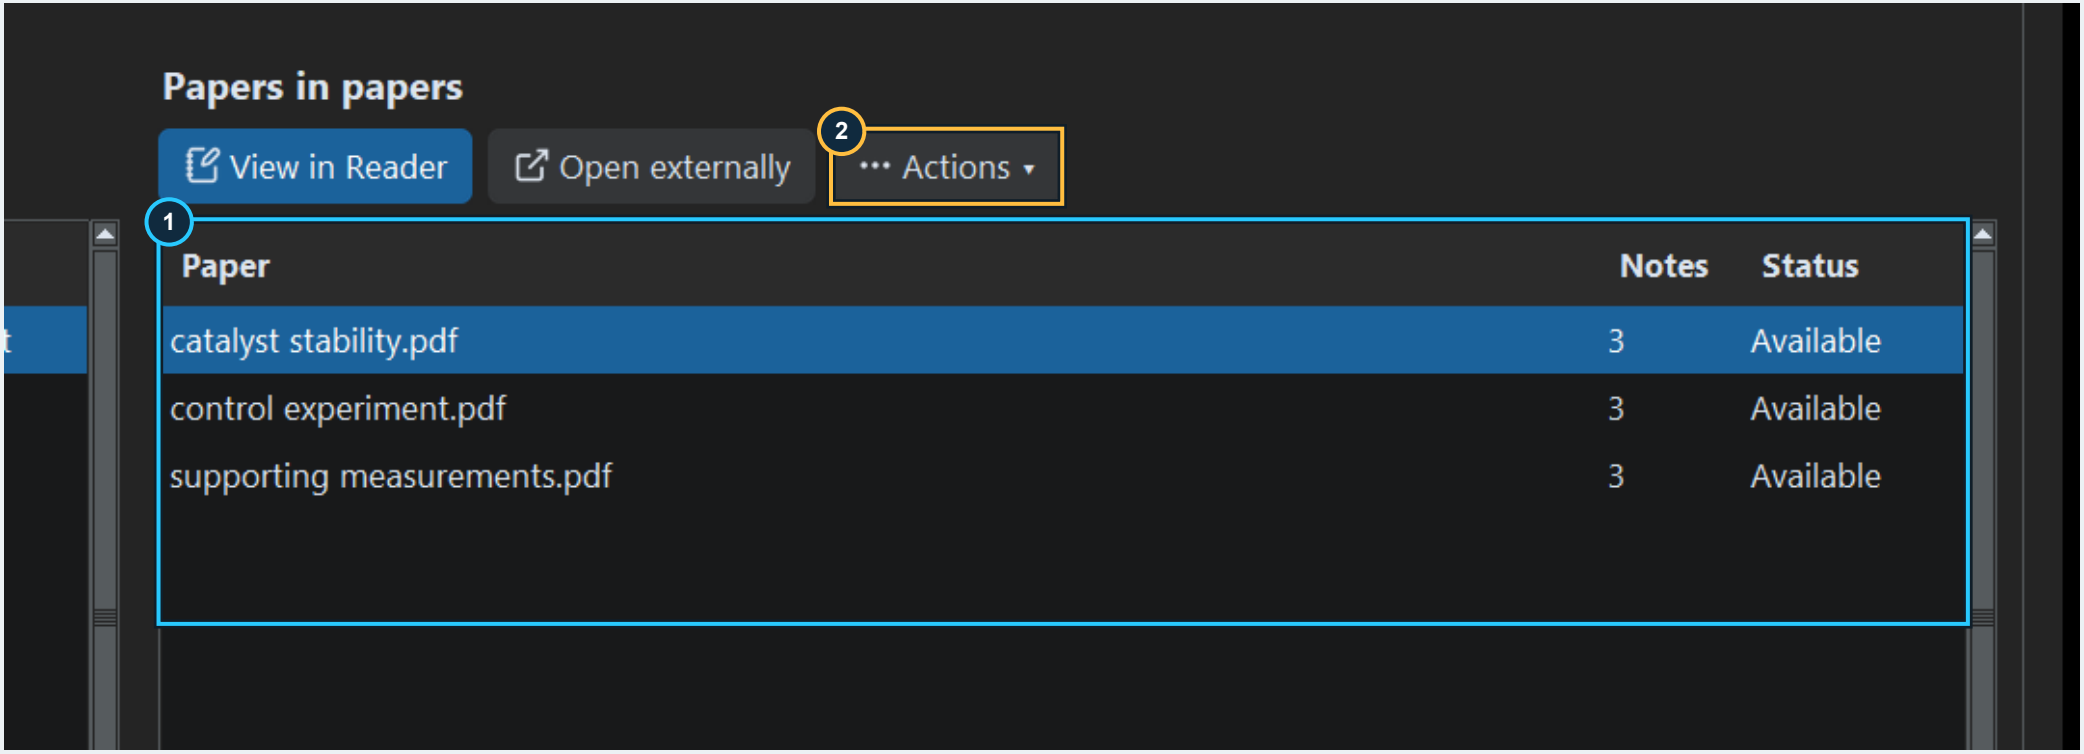

1. Make a separate writing copy **2.** Export currently filtered annotations

What to expect: The exported file is separate from the generated notebook. PDF document/page search rows do not become notes in Export view.

Export an annotated PDF

1. Select a paper in Library, then open Actions □.

Start here: Choose the paper whose combined PC/tablet annotations you want to share. Uncertain source versions must be reviewed first.

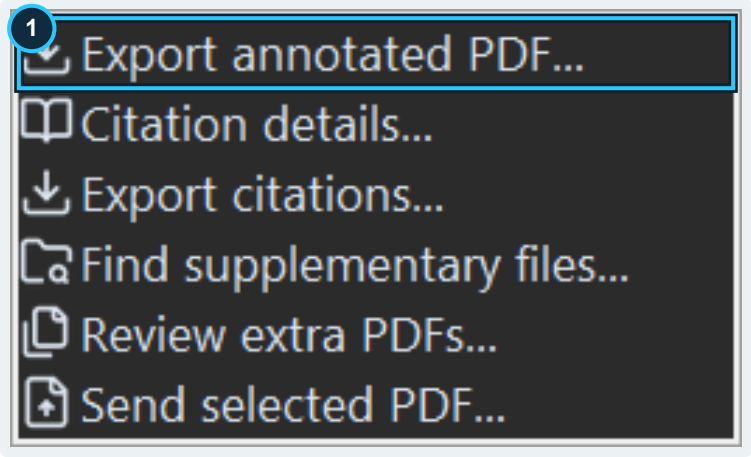

1. Choose the paper **2.** Open paper exports

What to expect: Paper actions are available for the selected document.

Export an annotated PDF

2. Choose Export annotated PDF… and select a new PDF destination in the save dialog.

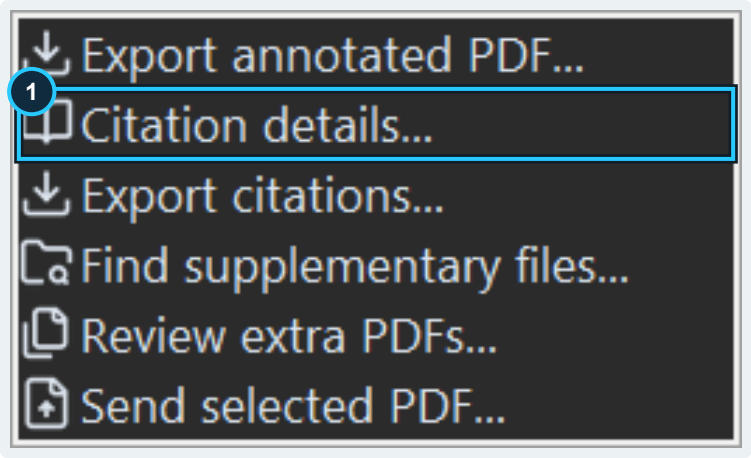

1. Save a separate annotated PDF

What to expect: Notable writes a separate annotated PDF. Supported margin handwriting receives extra white space without altering the original source file.

Review and save citation details

1. Choose Actions → Citation details….

Start here: Select a paper in Library or Reader. Citation edits are stored separately and survive PDF rescans.

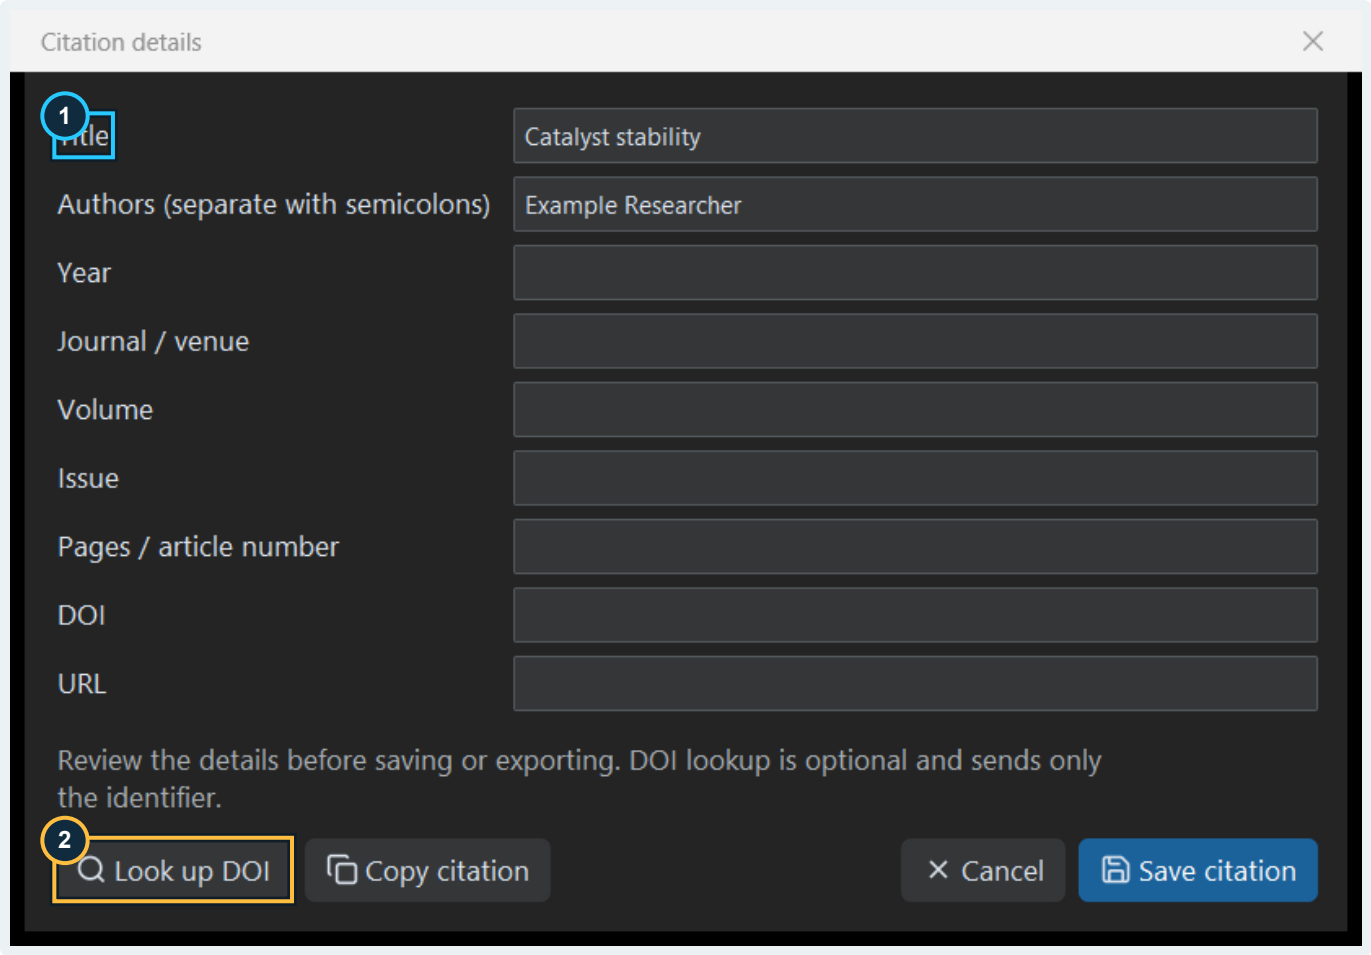

1. Open editable citation fields

What to expect: The citation dialog loads the paper's saved details or available PDF metadata.

Review and save citation details

2. Review Title, Authors, Year, journal and identifiers. Separate authors with semicolons. If you have an exact DOI, click Look up DOI and review the returned fields.

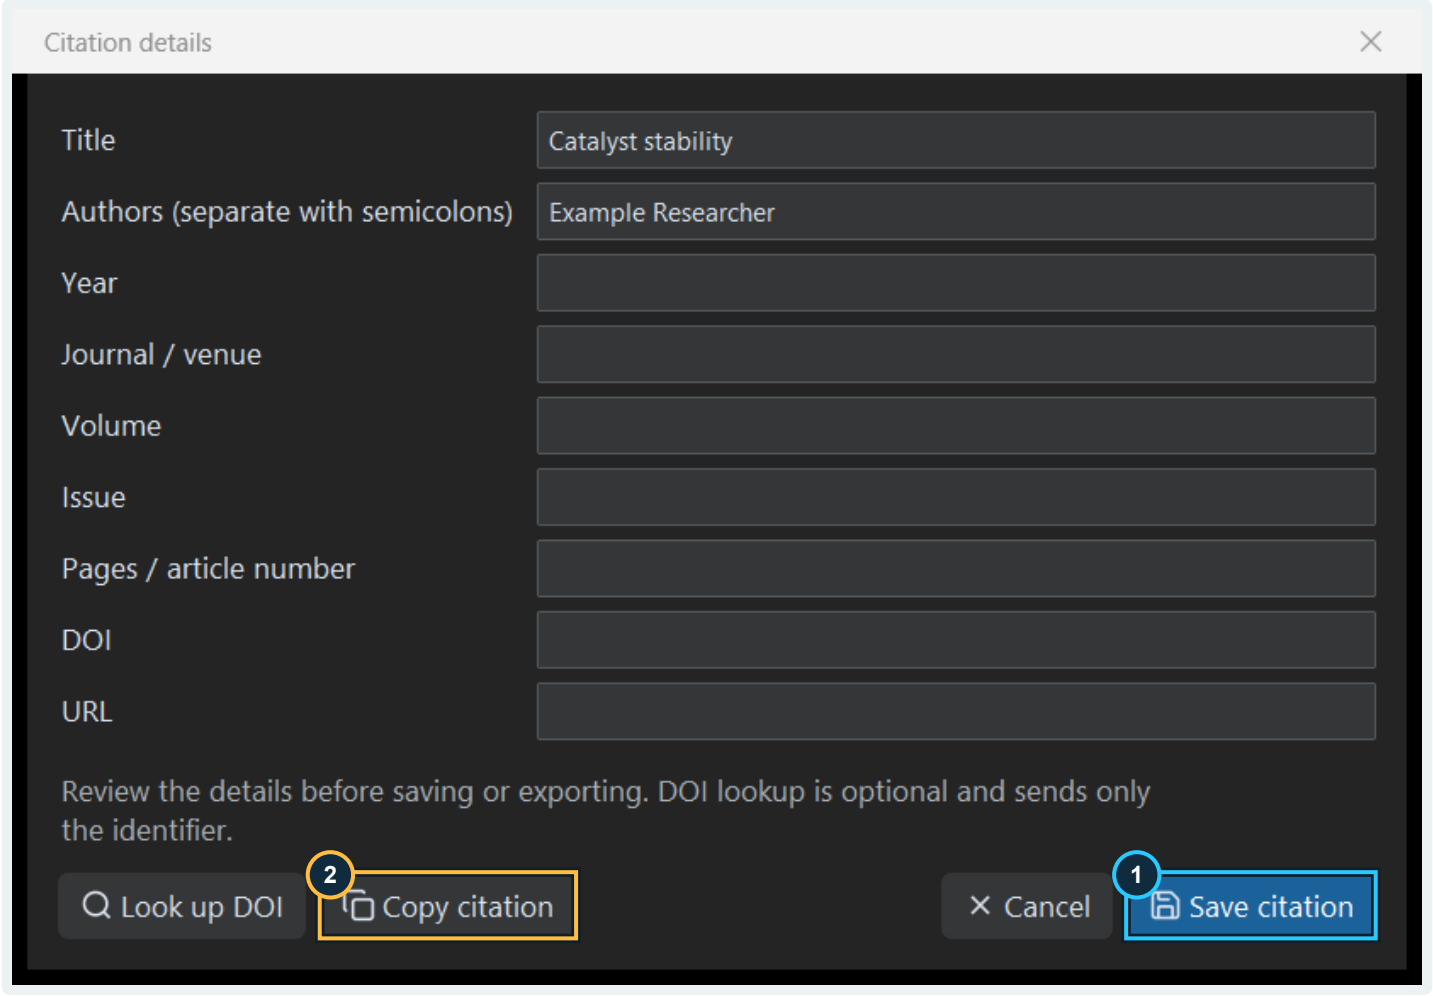

1. Review the paper title **2.** Optional identifier lookup

What to expect: DOI lookup sends the identifier to Crossref/DataCite and fills a draft. It does not save automatically or send the PDF.

Review and save citation details

3. Click Save citation to retain reviewed details, or Copy citation for a plain-text reference. Cancel discards unsaved edits.

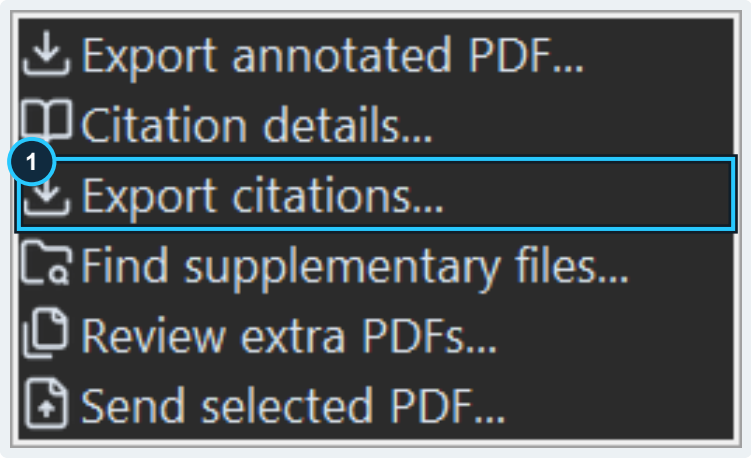

1. Keep reviewed citation details **2.** Copy the current draft as text

What to expect: Saved details are shared with linked copies and improve displayed titles and paper searches. They do not become annotation-text matches.

Export citations as RIS or BibTeX

1. Choose Actions → Export citations….

Start here: In Library, select a paper or folder. In Reader, prepare the current paper/search selection.

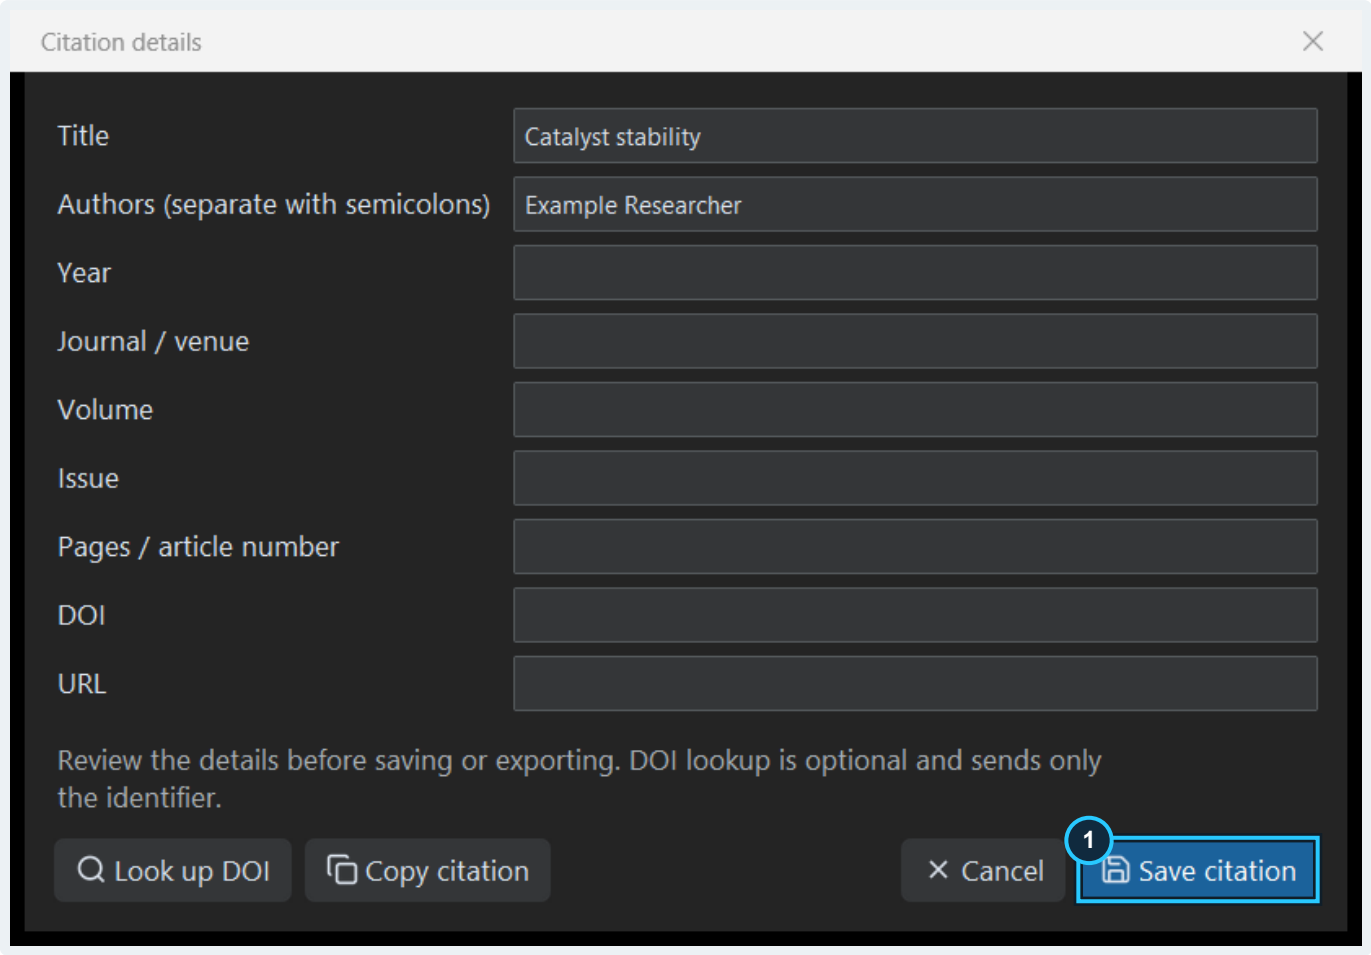

1. Export reviewed references

What to expect: A save dialog lets you choose a citation format and destination.

Export citations as RIS or BibTeX

2. Before export, use Citation details to fill missing fields and save them. Export to .ris for RIS or .bib for BibTeX, then import the file into your reference manager.

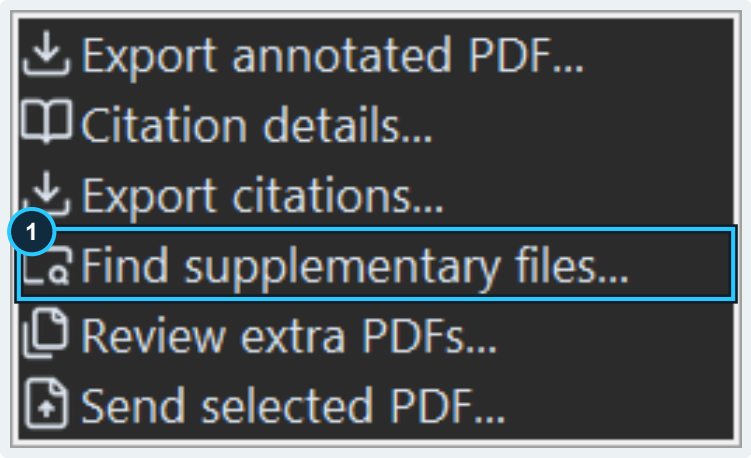

1. Save corrections before exporting

What to expect: Linked paper variants export once. Check the imported reference; the available citation fields determine its completeness.

Find or attach supplementary files

1. Choose Actions → Find supplementary files….

Start here: Select the parent paper first. Discovery is explicit; publisher access and metadata may limit what can be found.

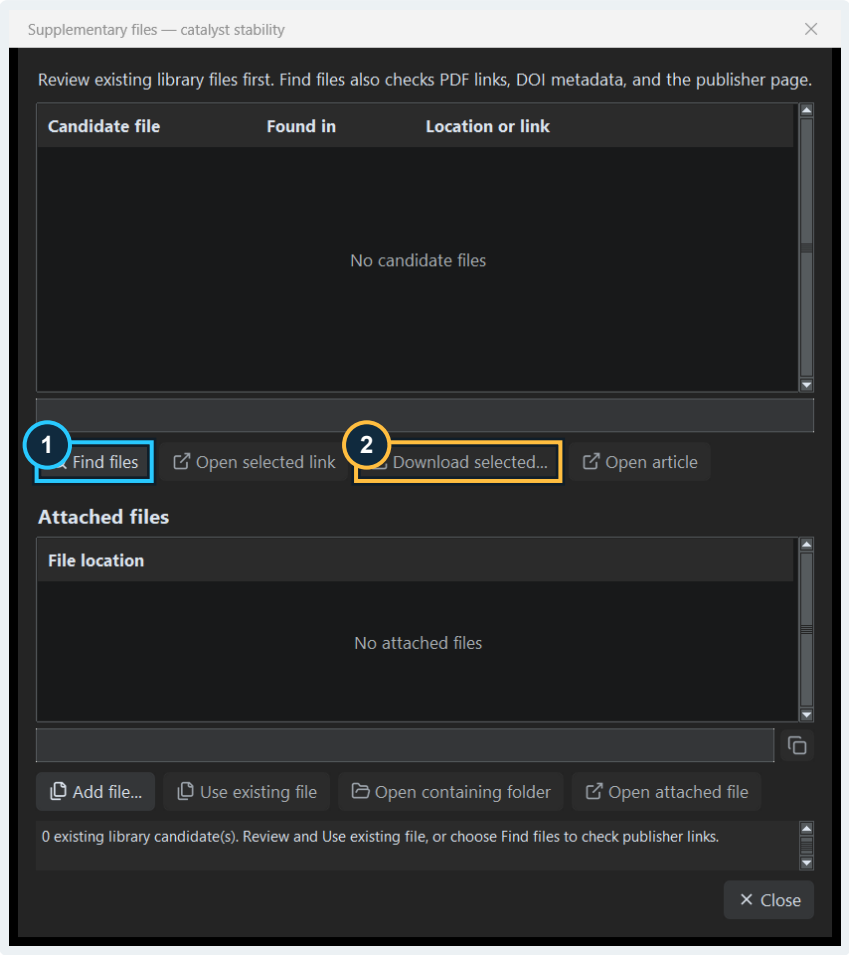

1. Open this paper's supplements

What to expect: The supplementary-files window opens with candidate links and already attached files.

Find or attach supplementary files

2. Click Find files to look for candidate links. Select a candidate, inspect its URL, then choose Open selected link or Download selected…. Review the proposed destination before saving.

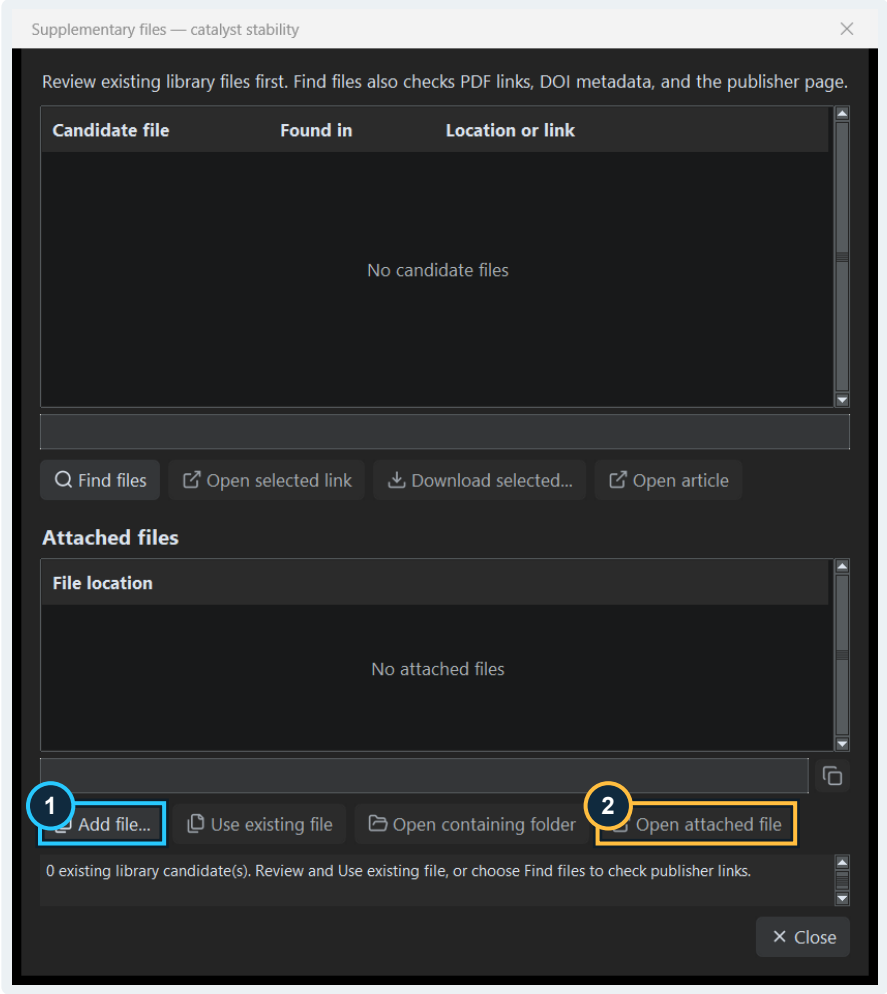

1. Explicitly discover candidates **2.** Review before downloading

What to expect: Discovery does not download automatically. Use existing file reuses a matching local candidate; publisher restrictions may require your browser.

Find or attach supplementary files

3. For a file already on your PC, click Add file… and select it. Select an attachment to use Open attached file or Open containing folder.

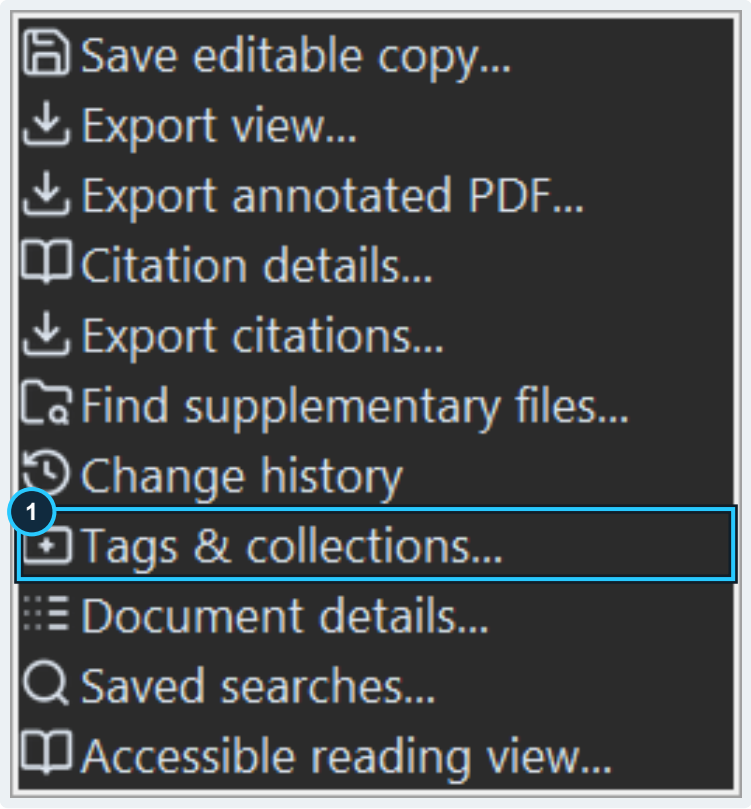

1. Attach an existing local file **2.** Open the selected attachment

What to expect: The association is saved with the parent paper and survives rescans. Attachments are separate files rather than notes inserted into the parent PDF.

Organize papers with tags and collections

1. With a paper selected, choose Actions → Tags & collections….

Start here: Labels group papers without moving or copying their files. They are local to this saved library.

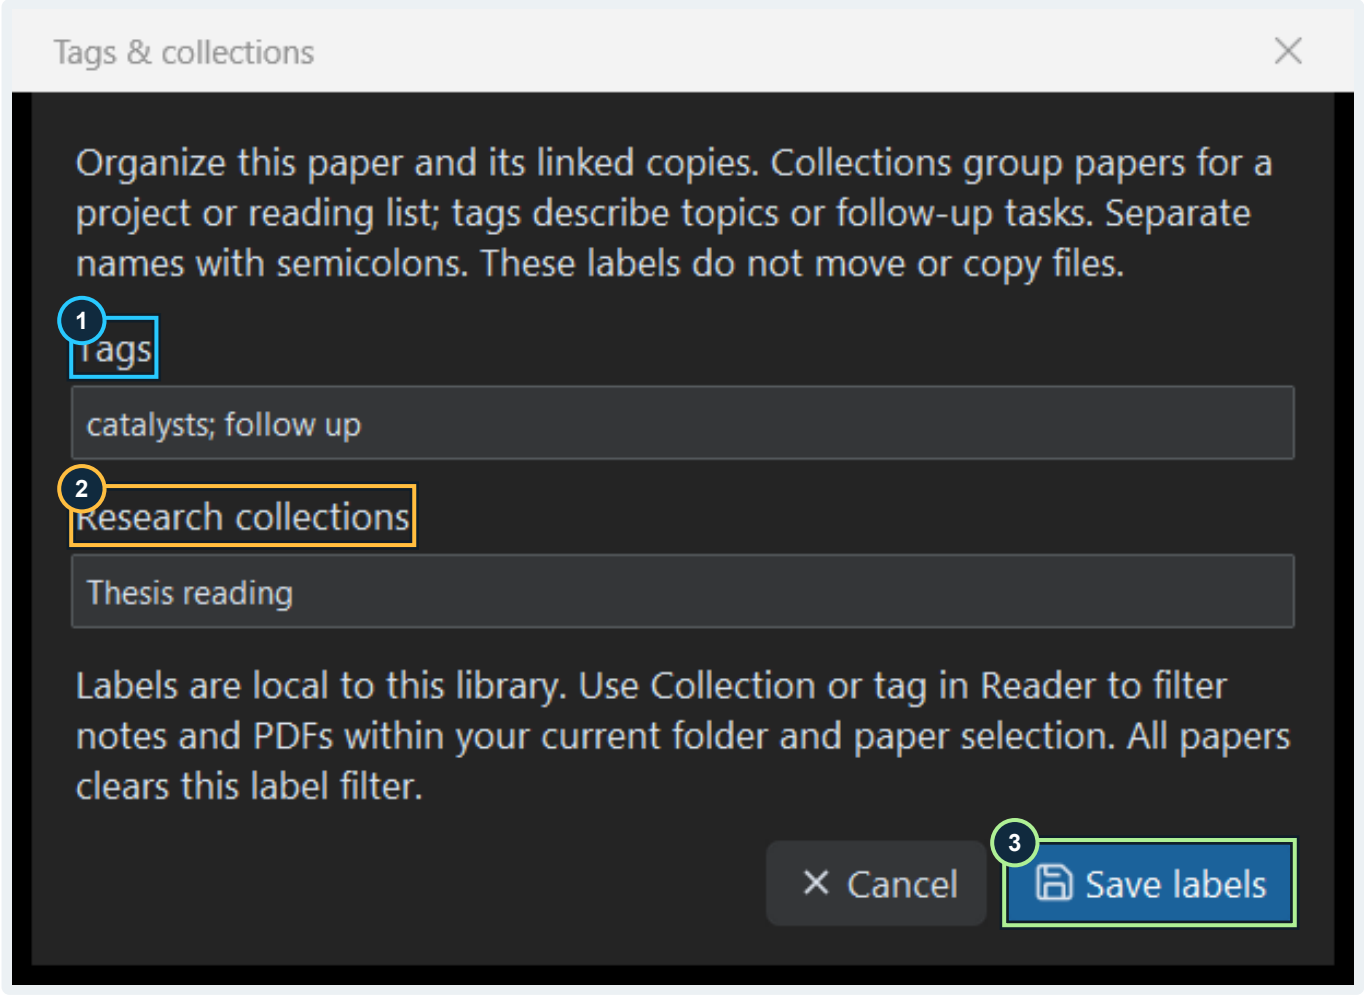

1. Edit this paper’s local labels

What to expect: The dialog loads that paper’s current tags and research collections.

Organize papers with tags and collections

2. Enter Tags and Research collections separated with semicolons, then click Save labels.

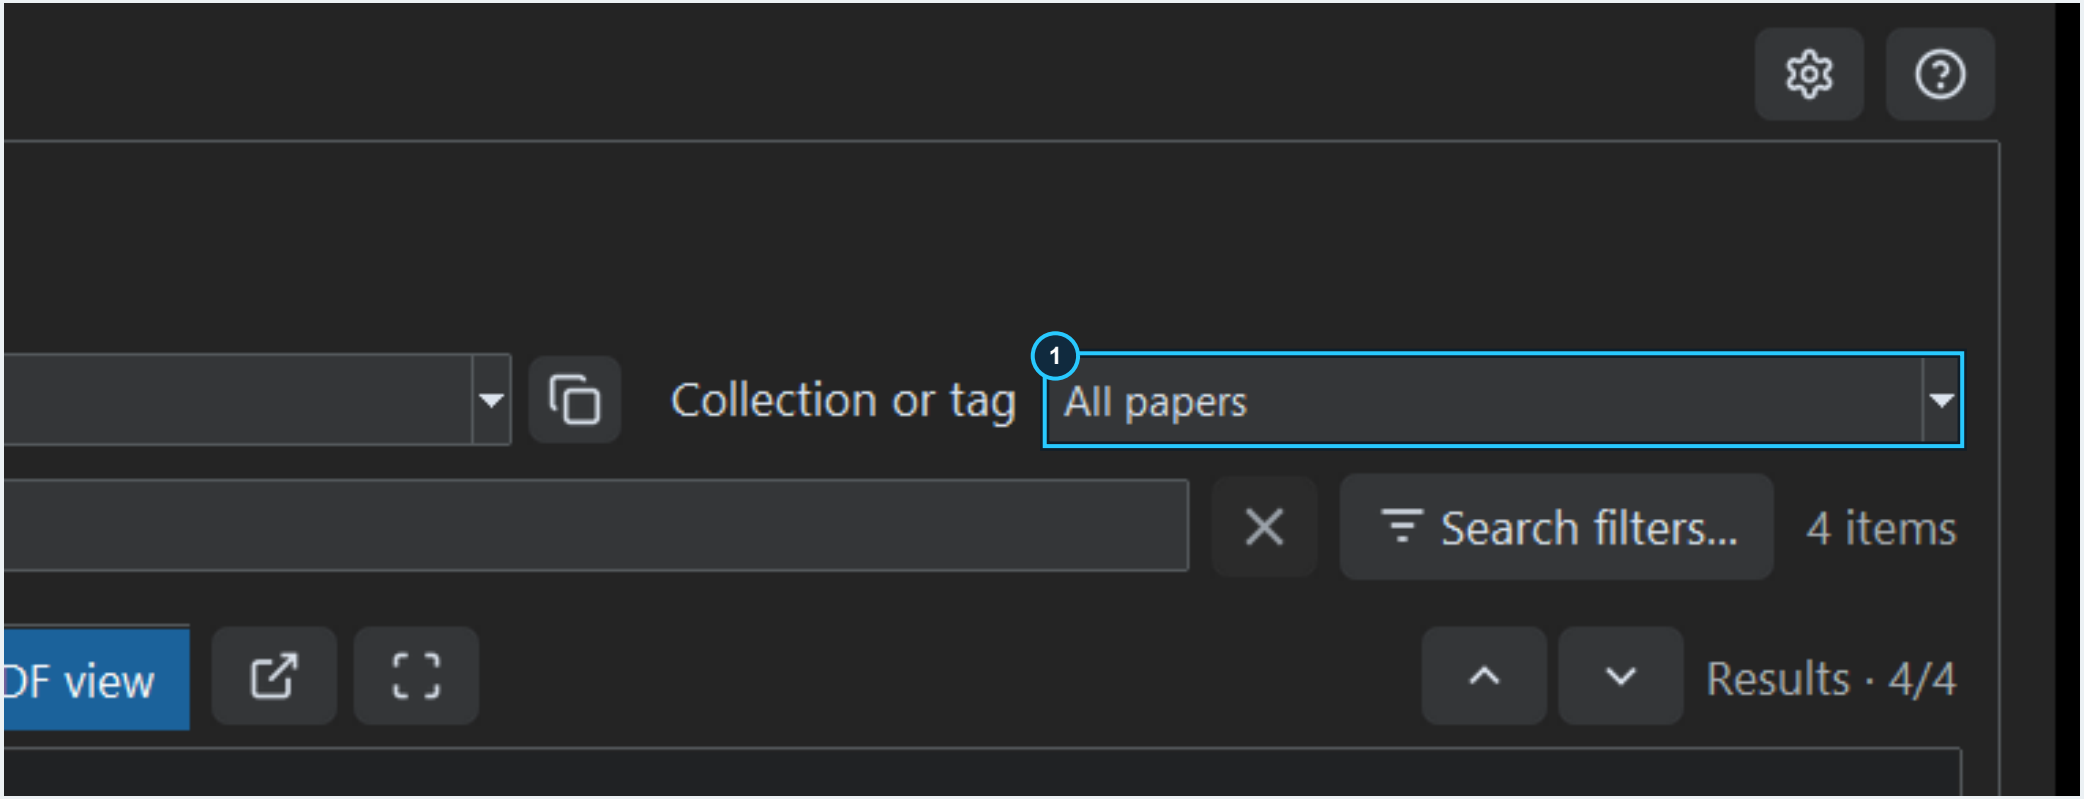

1. Semicolon-separated topics or tasks **2.** Project or reading-list groups **3.** Save these labels

What to expect: The labels are saved for this paper and its linked copies. Cancel discards draft edits.

Organize papers with tags and collections

3. Choose the saved label in Collection or tag. Choose All papers there to clear only the label filter.

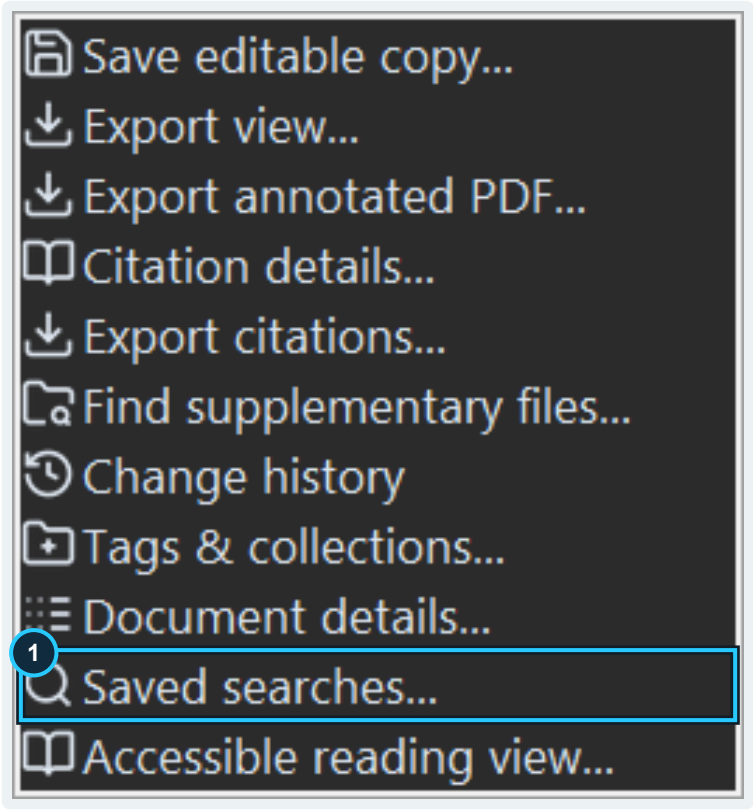

1. Filter by a saved tag or collection

What to expect: Reader narrows notes and PDFs within the currently selected folder and paper.

Save and reuse a search

1. Choose Actions → Saved searches… or press Ctrl+Shift+S.

Start here: First prepare the main query, scope, fields, note type and collection/tag filter you want to keep.

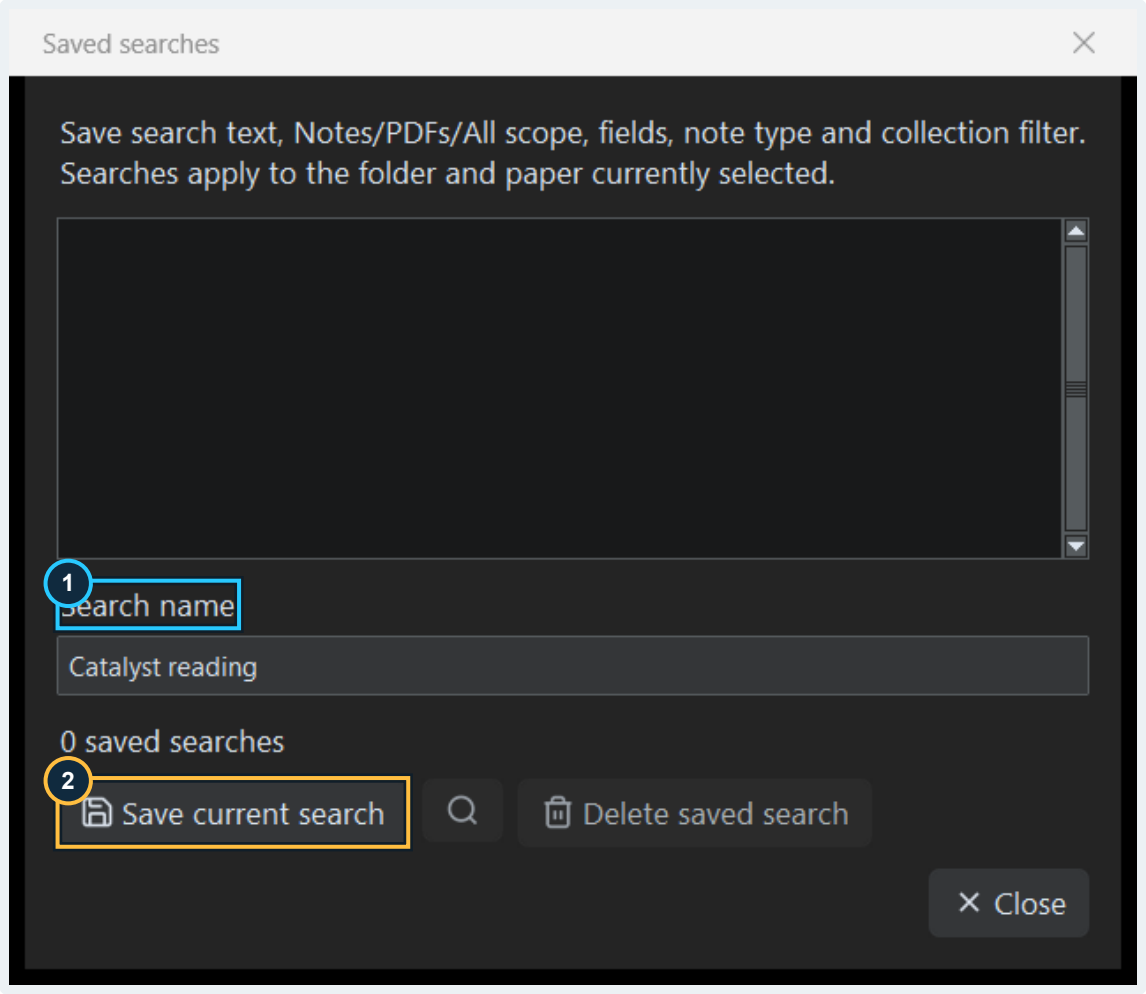

1. Manage reusable searches

What to expect: The saved-search window lists searches in this saved library.

Save and reuse a search

2. Enter a Search name, then click Save current search. Saving the same name updates it.

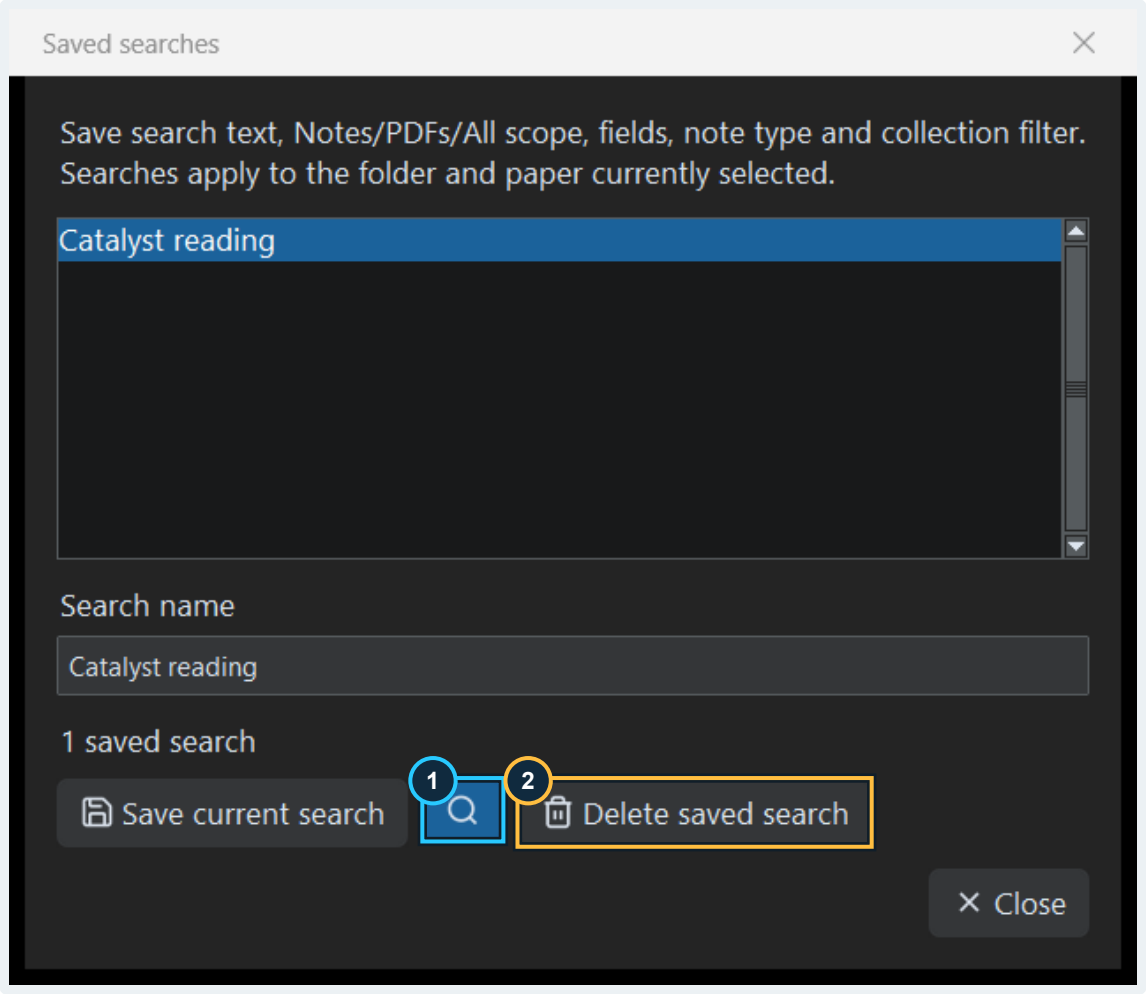

1. Name the prepared search **2.** Save the current query and filters

What to expect: The search is retained with its query and filter choices. The name is for finding it later.

Save and reuse a search

3. Select a saved search and click Apply saved search. To remove only the saved preset, use Delete saved search.

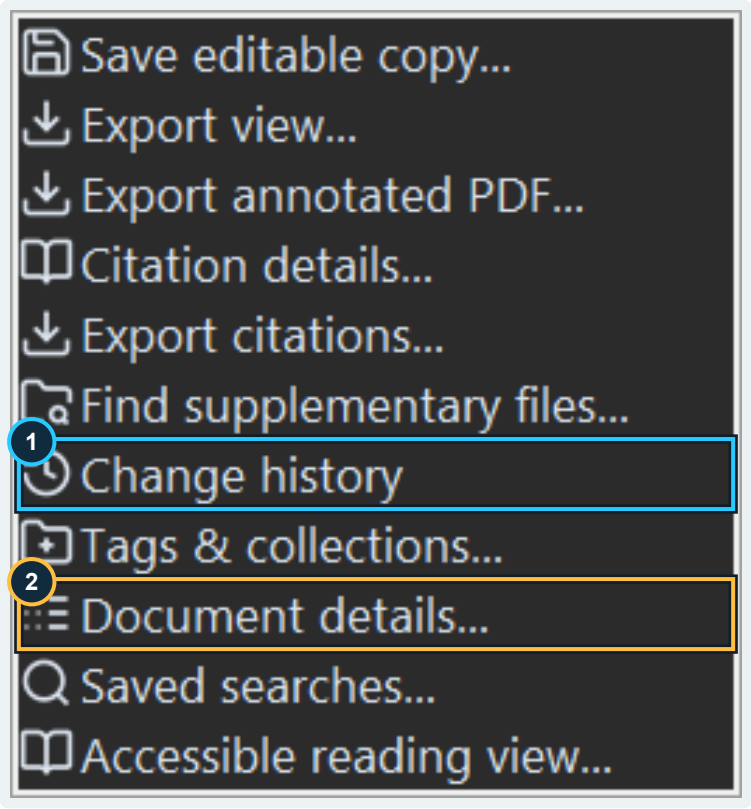

1. Apply the selected preset **2.** Remove only this preset

What to expect: Applying restores that search’s options in the folder and paper currently selected. Deleting a preset does not remove any notes or PDFs.

Read history, identity or an accessible view

1. Choose Change history for annotation revisions, or Document details… for identity, source paths and extraction diagnostics.

Start here: Select the paper or note whose information you want to inspect.

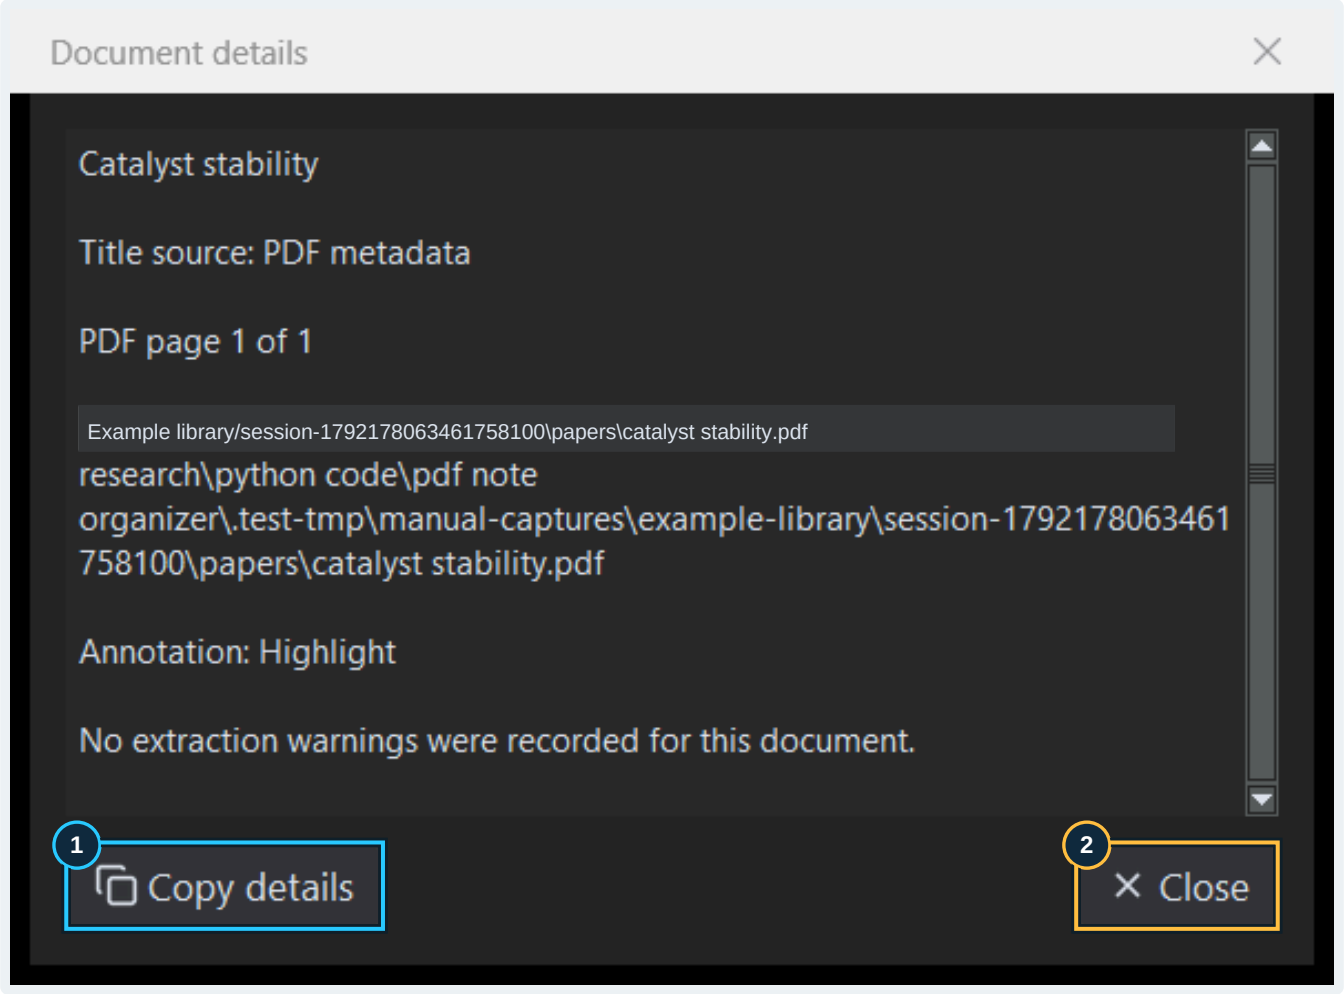

1. Inspect saved annotation revisions **2.** Inspect identity and diagnostics

What to expect: History follows the selected note’s actual source. Document details explains titles and page information without changing the PDF.

Read history, identity or an accessible view

2. Read the document details and use Copy details when reporting a problem. Close the window when finished.

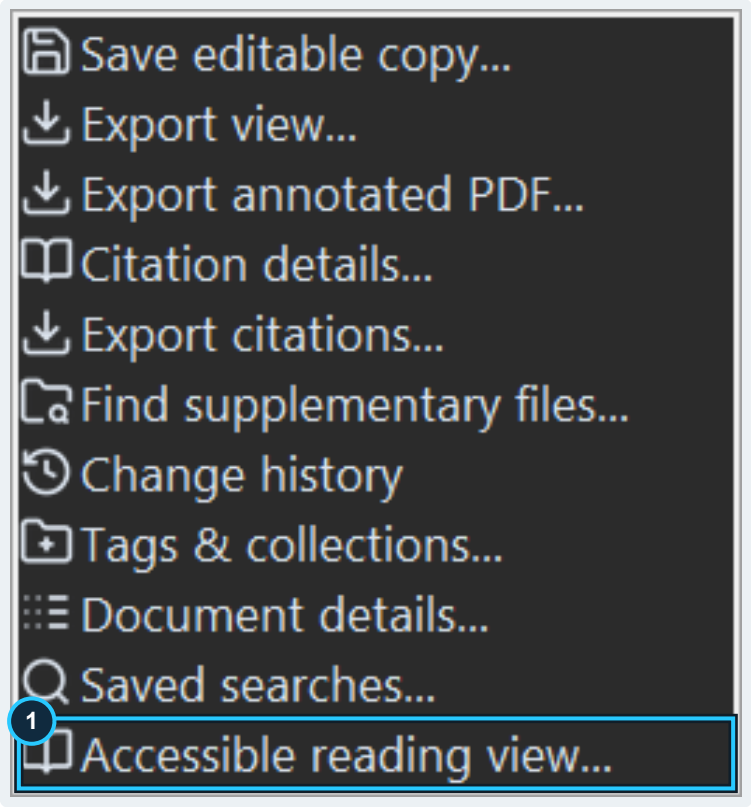

1. Copy the displayed information **2.** Return to Reader

What to expect: Physical page positions are kept separate from embedded PDF labels. A PDF label is not a verified journal page number.

Read history, identity or an accessible view

3. Choose Accessible reading view… to open the current results in your browser.

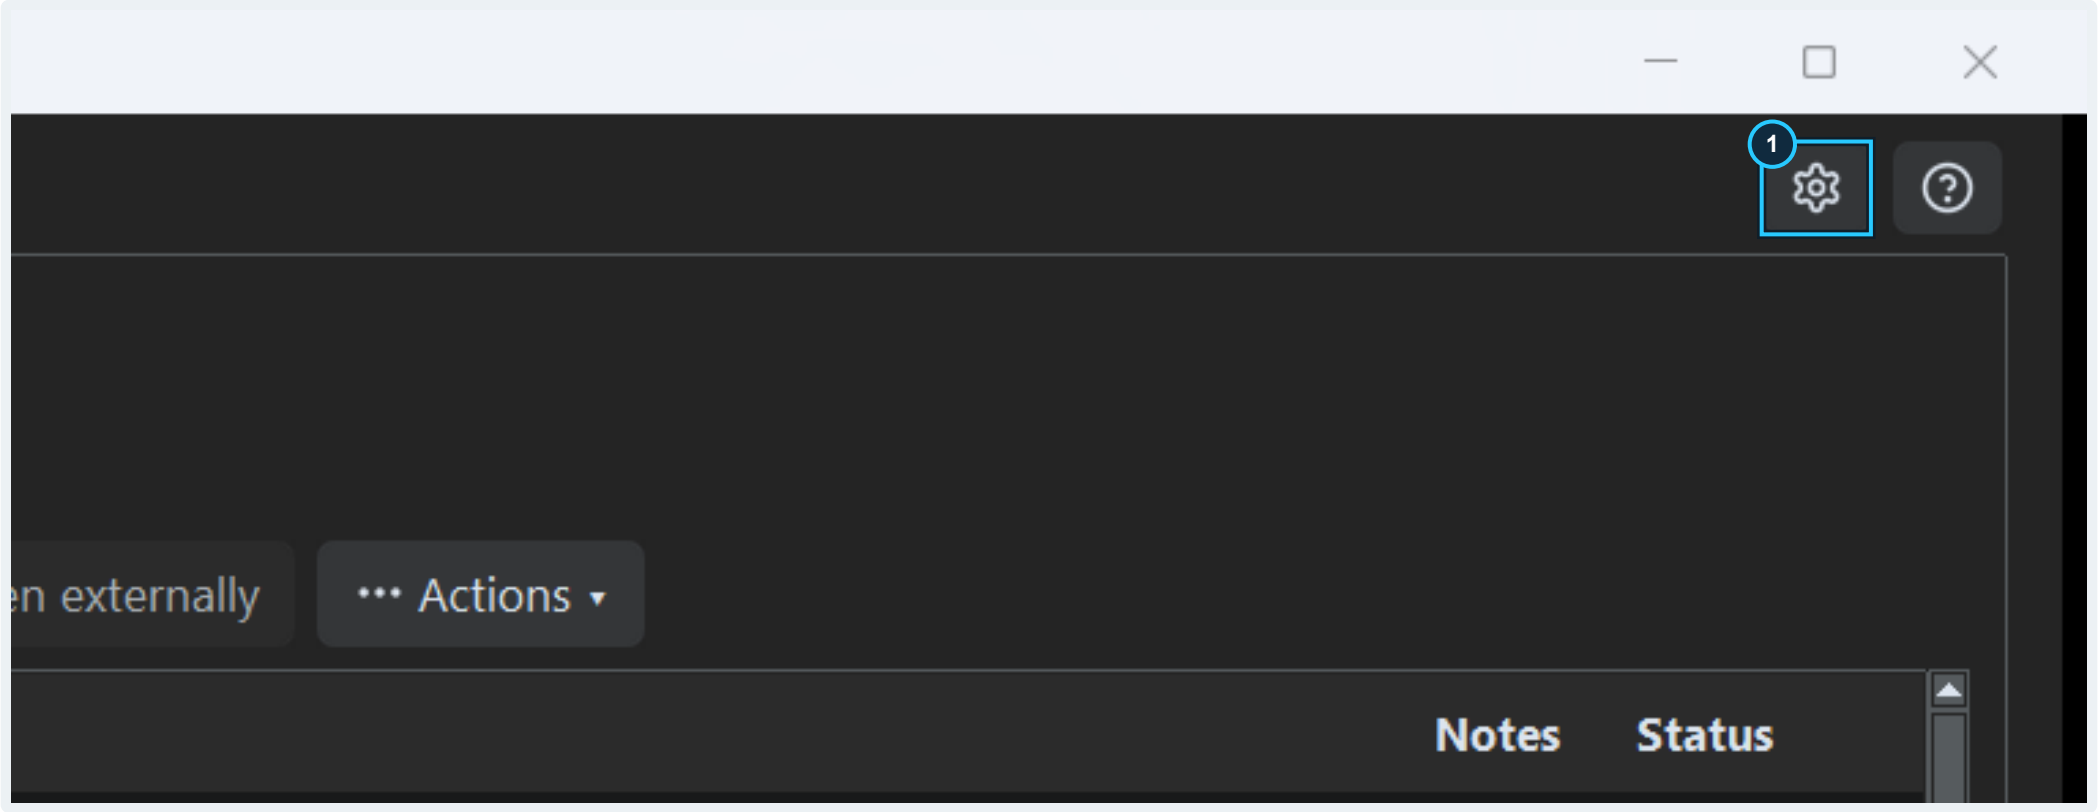

1. Open an accessible results page

What to expect: The generated page uses semantic headings and keyboard-friendly content for screen readers. It contains your current results; treat exported content as your own research data.

Set up Inbox folders and naming

1. Click Settings (the gear), then select Sorting.

Start here: The incoming folder and library root must be separate existing areas; neither may contain the other or be inside Notable's private data/cache folders.

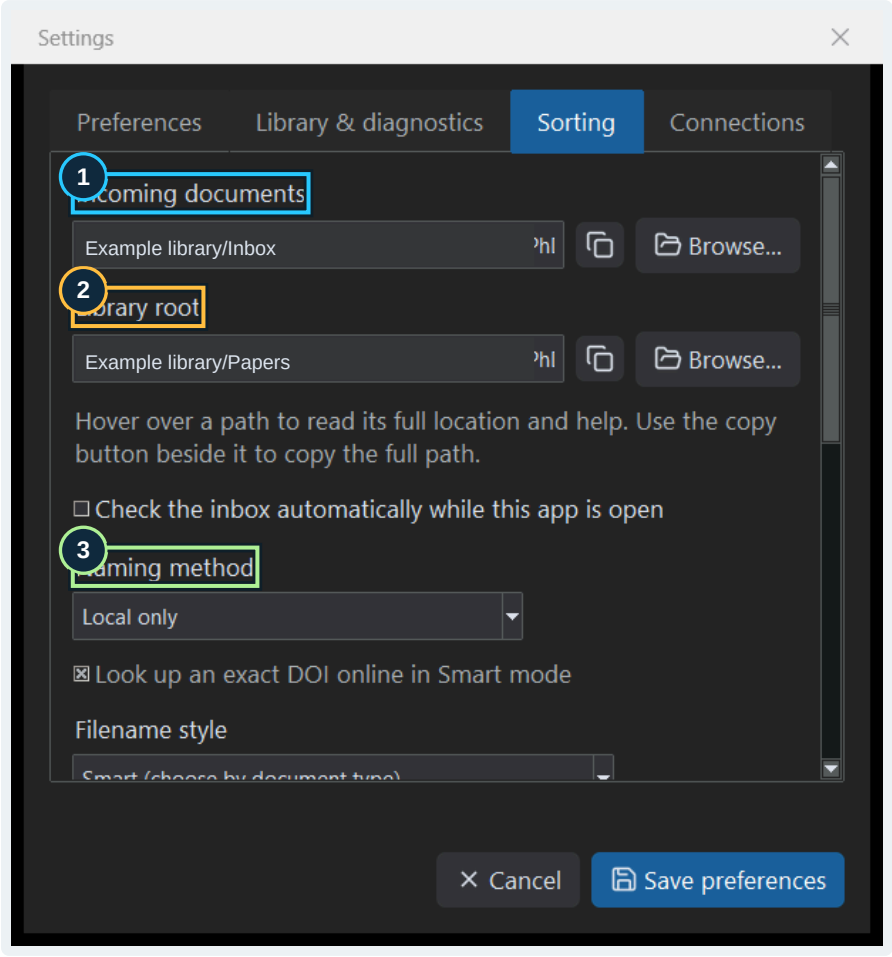

1. Open app preferences

What to expect: Settings contains the incoming folder, library root and naming permissions.

Set up Inbox folders and naming

2. Browse to Incoming documents and Library root. Choose Local only to keep identification on this PC, or Smart metadata lookup for optional exact-DOI lookup. Choose a Filename style.

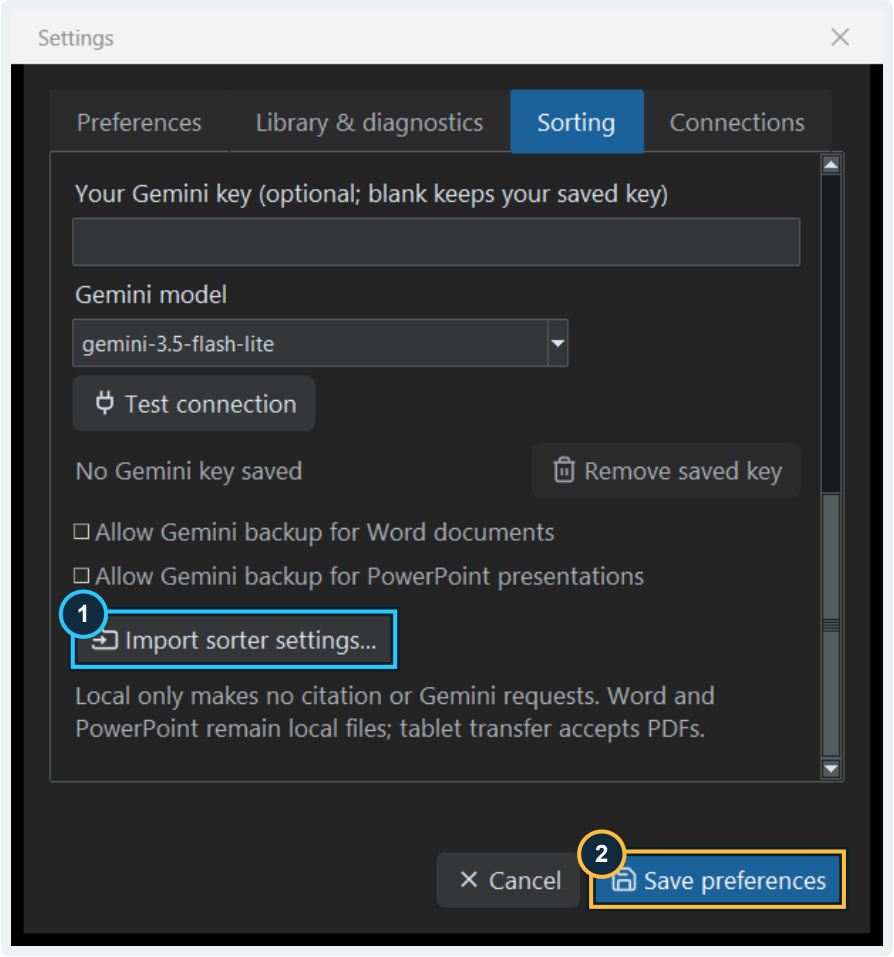

1. Folder for unfinished downloads **2.** Root for filed documents **3.** Choose local or online identification

What to expect: Local only makes no naming-service requests. Gemini is a separate opt-in and requires your own key; Word and PowerPoint each need their own text-sharing permission.

Set up Inbox folders and naming

3. Enable automatic Inbox checks if wanted. Scroll down to review optional naming permissions, then click Save preferences. To import old sorter settings, use Import sorter settings… and inspect the draft before saving.

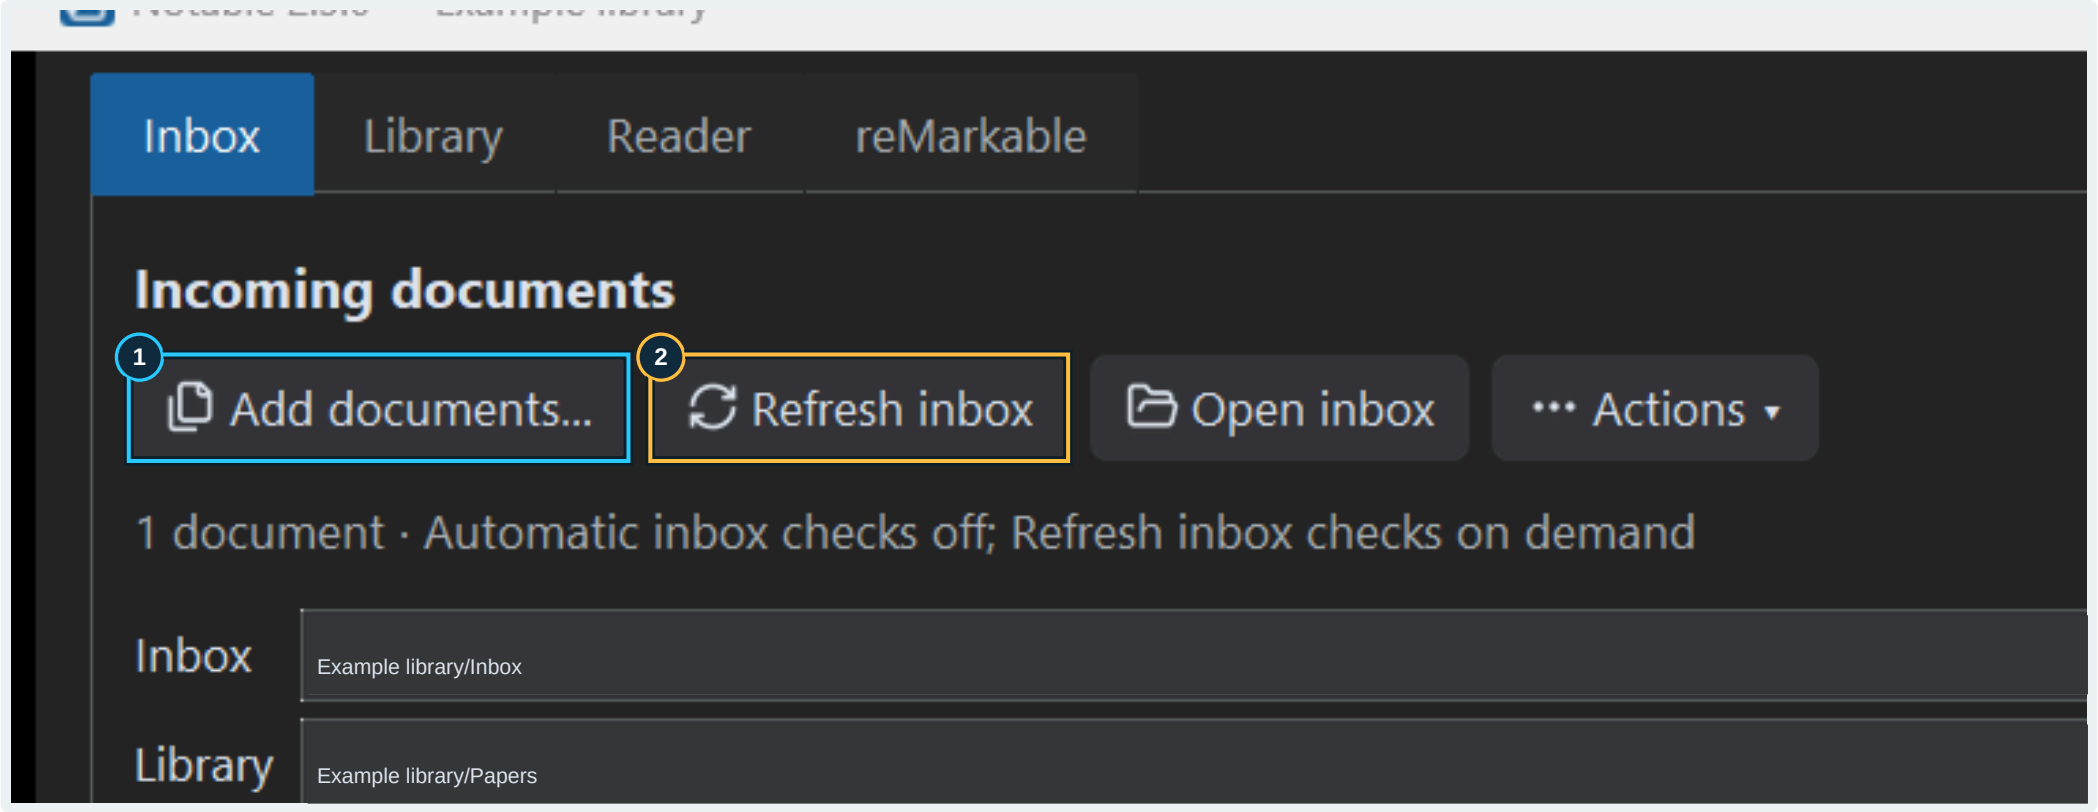

1. Optional old sorter configuration **2.** Commit the reviewed settings

What to expect: All Settings tabs save together. Import does not enable Gemini or copy a key. Automatic checks run only while the app is open; manual Refresh inbox remains available.

Review and file an incoming document

1. Put a supported file directly in the incoming folder, use Add documents…, or drag it onto the Inbox list. Click Refresh inbox if necessary.

Start here: Inbox supports PDF, DOCX, PPTX and legacy PPT. Only PDFs enter note extraction, notebooks and tablet paper transfers.

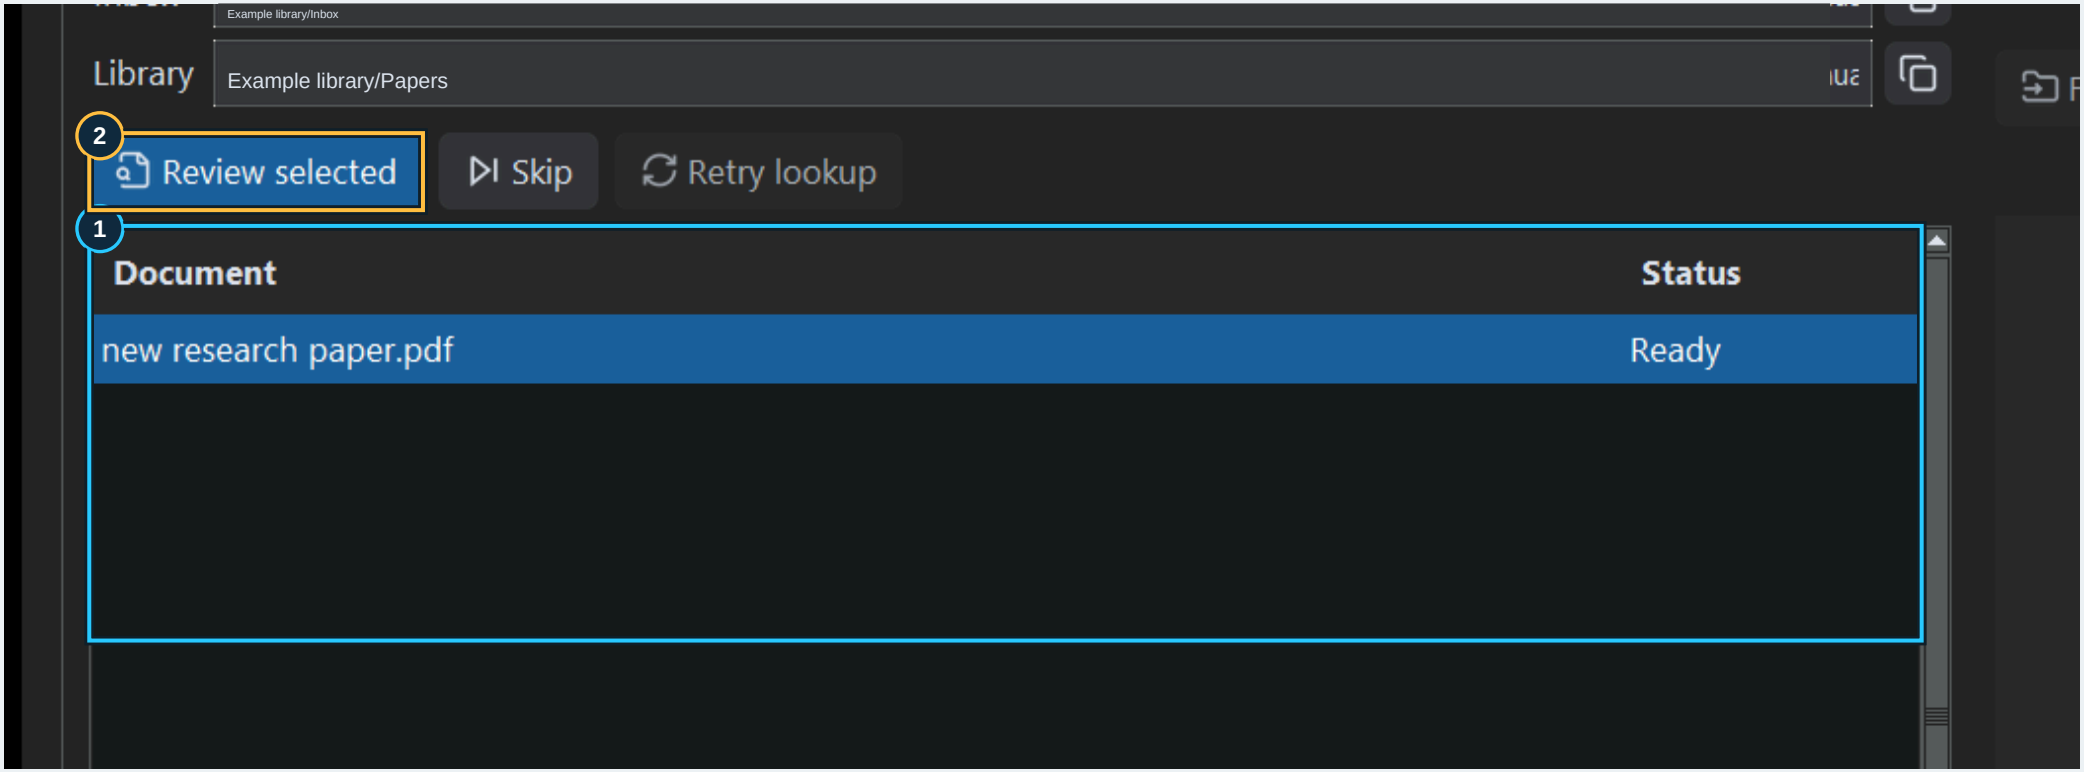

1. Copy supported files into Inbox **2.** Check which downloads are ready

What to expect: Notable waits for the download to stop changing and become readable. Add documents copies the selected external source into Inbox; it does not move that source.

Review and file an incoming document

2. Select a ready document and click Review selected.

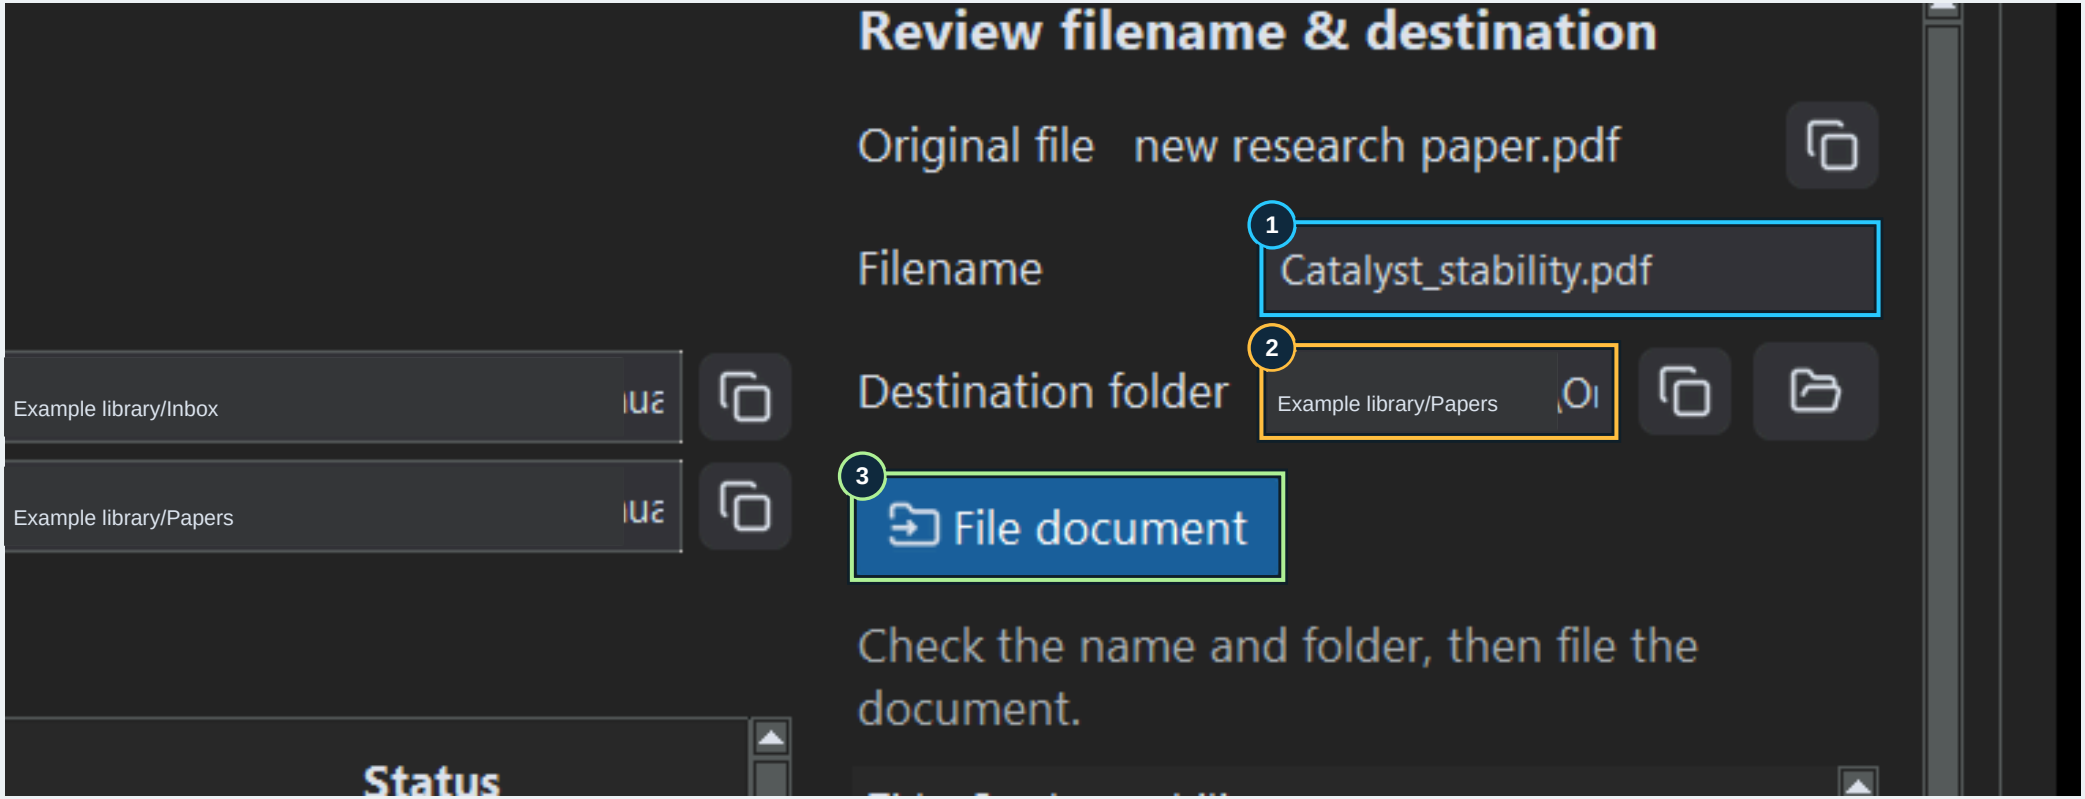

1. Select the ready document **2.** Prepare its filename and destination

What to expect: The right-hand form loads a proposed filename, destination and available identification details.

Review and file an incoming document

3. Inspect the proposed Filename and Destination folder. Edit the name if needed; keep a filename rather than a full path. Browse to an existing library subfolder or type a new one.

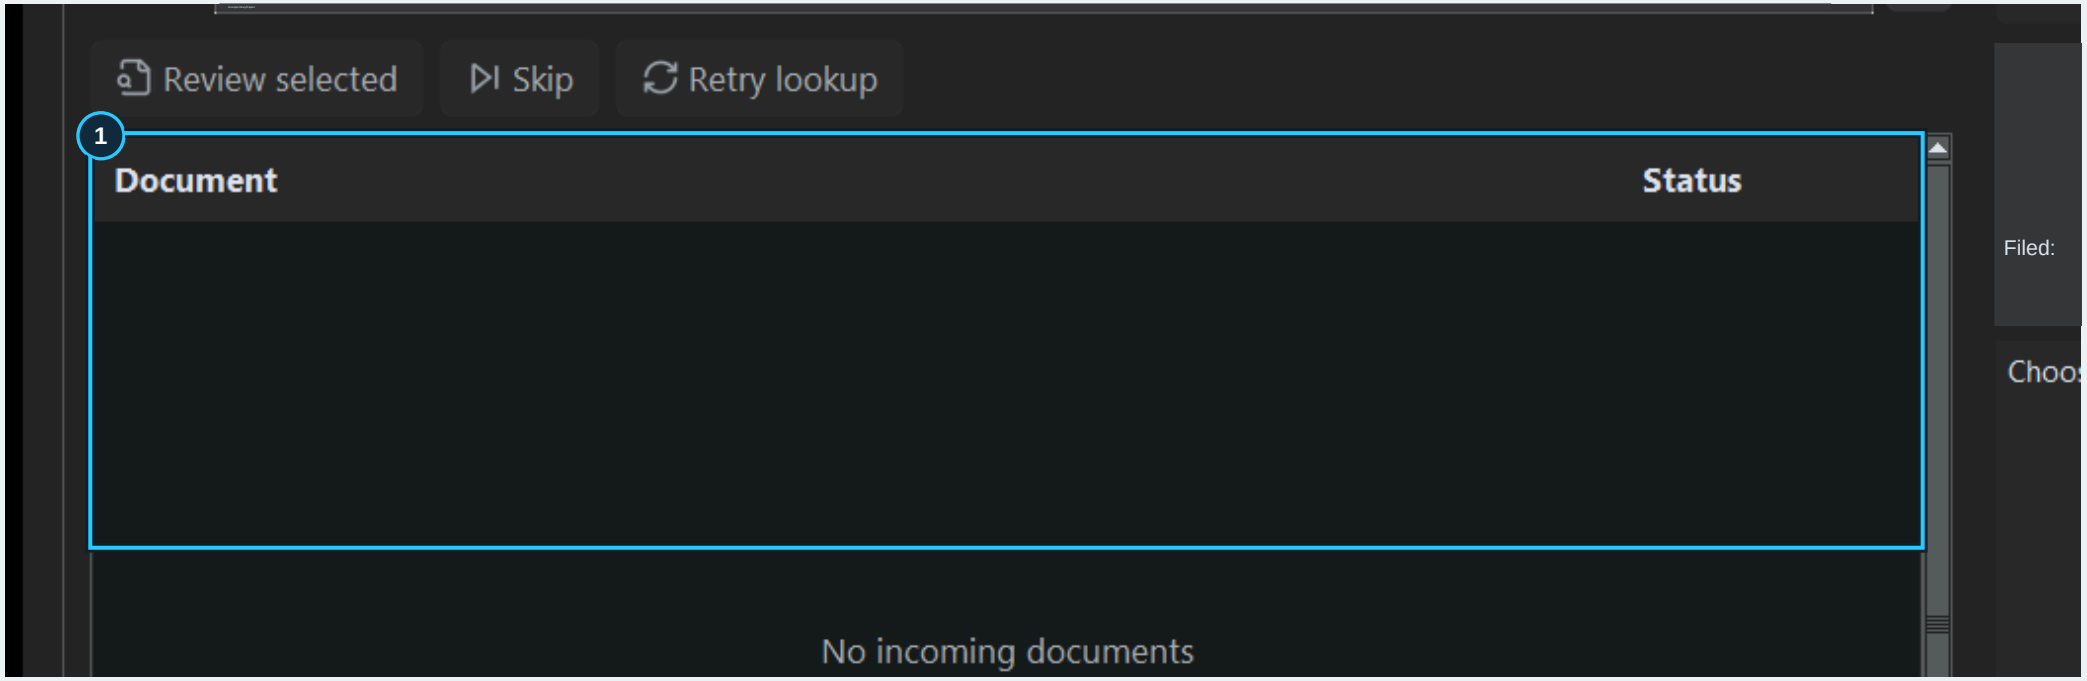

1. Review or edit the filename **2.** Choose a destination within the library **3.** Review the filing confirmation

What to expect: The original extension is retained. A new destination subfolder is created only after confirmed filing. Review identification explanations before proceeding.

Review and file an incoming document

4. Click File document, read the name and destination in the confirmation, and confirm.

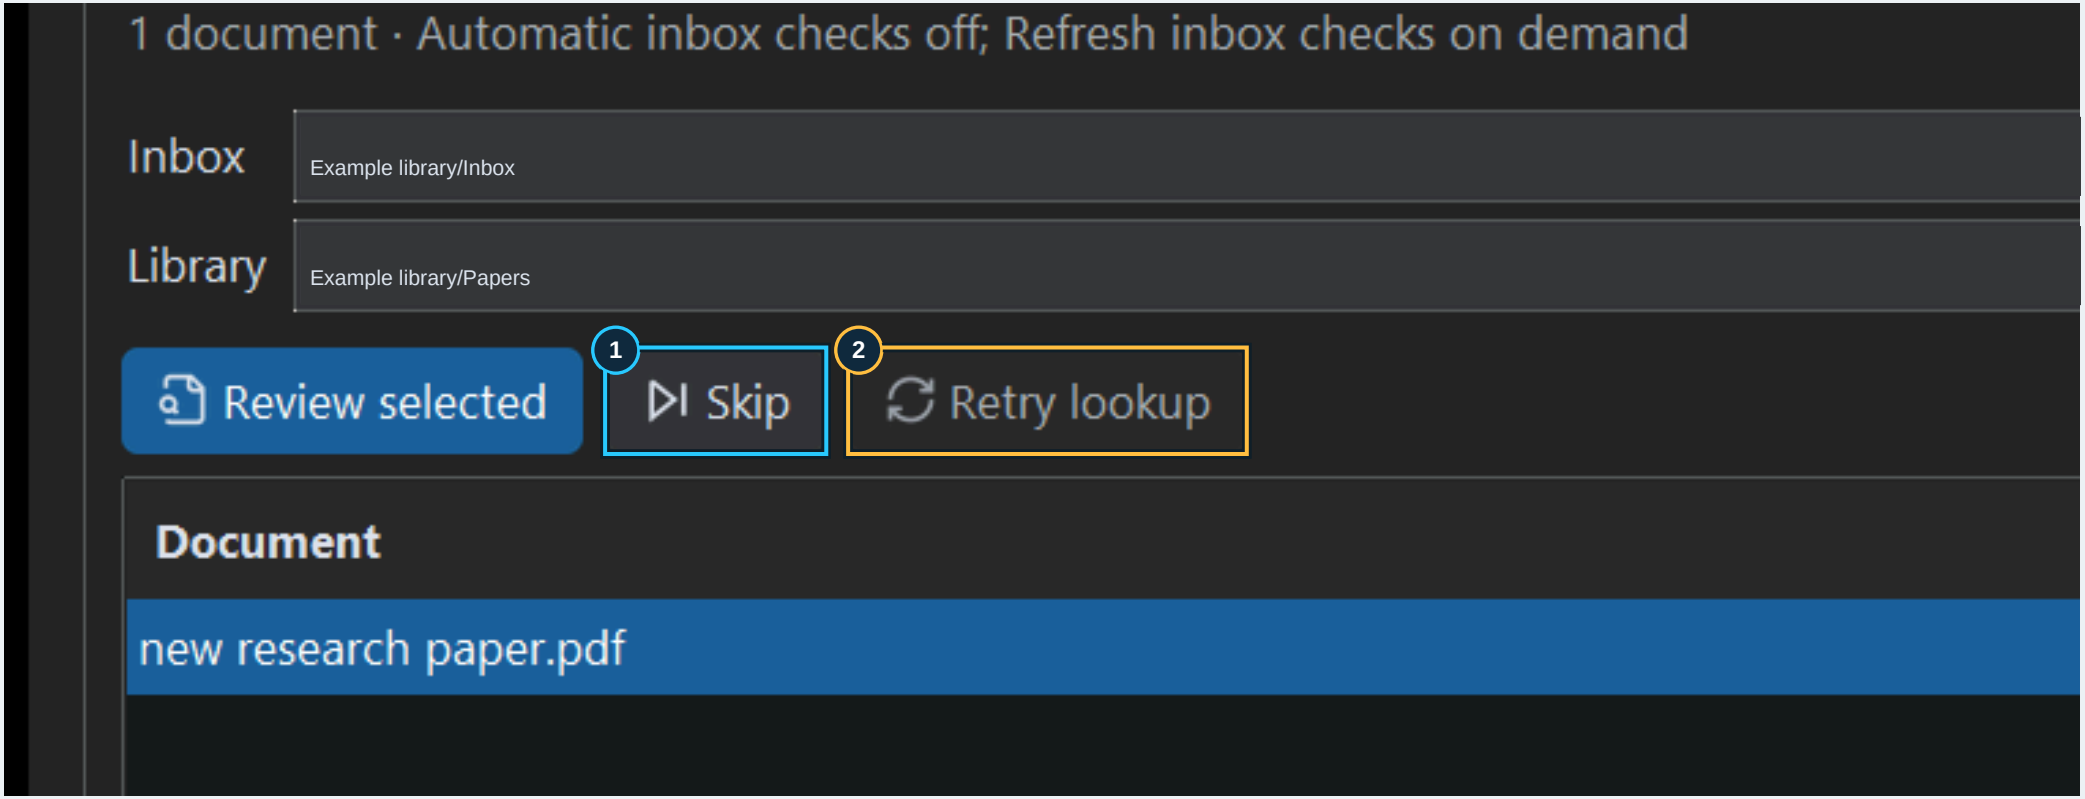

1. The filed item leaves the active Inbox list

What to expect: The document is copied and verified before the Inbox source is recycled. Existing destinations are not overwritten. A PDF becomes available for library processing; Office files do not become Reader PDFs.

Skip, retry or recover an Inbox filing

1. Select an Inbox item and use Skip to remember that decision. If identification offers Retry lookup, review its explanation before requesting another lookup.

Start here: Skip is useful for an item you do not want to file now. Recovery concerns an interrupted file operation, not a naming preset.

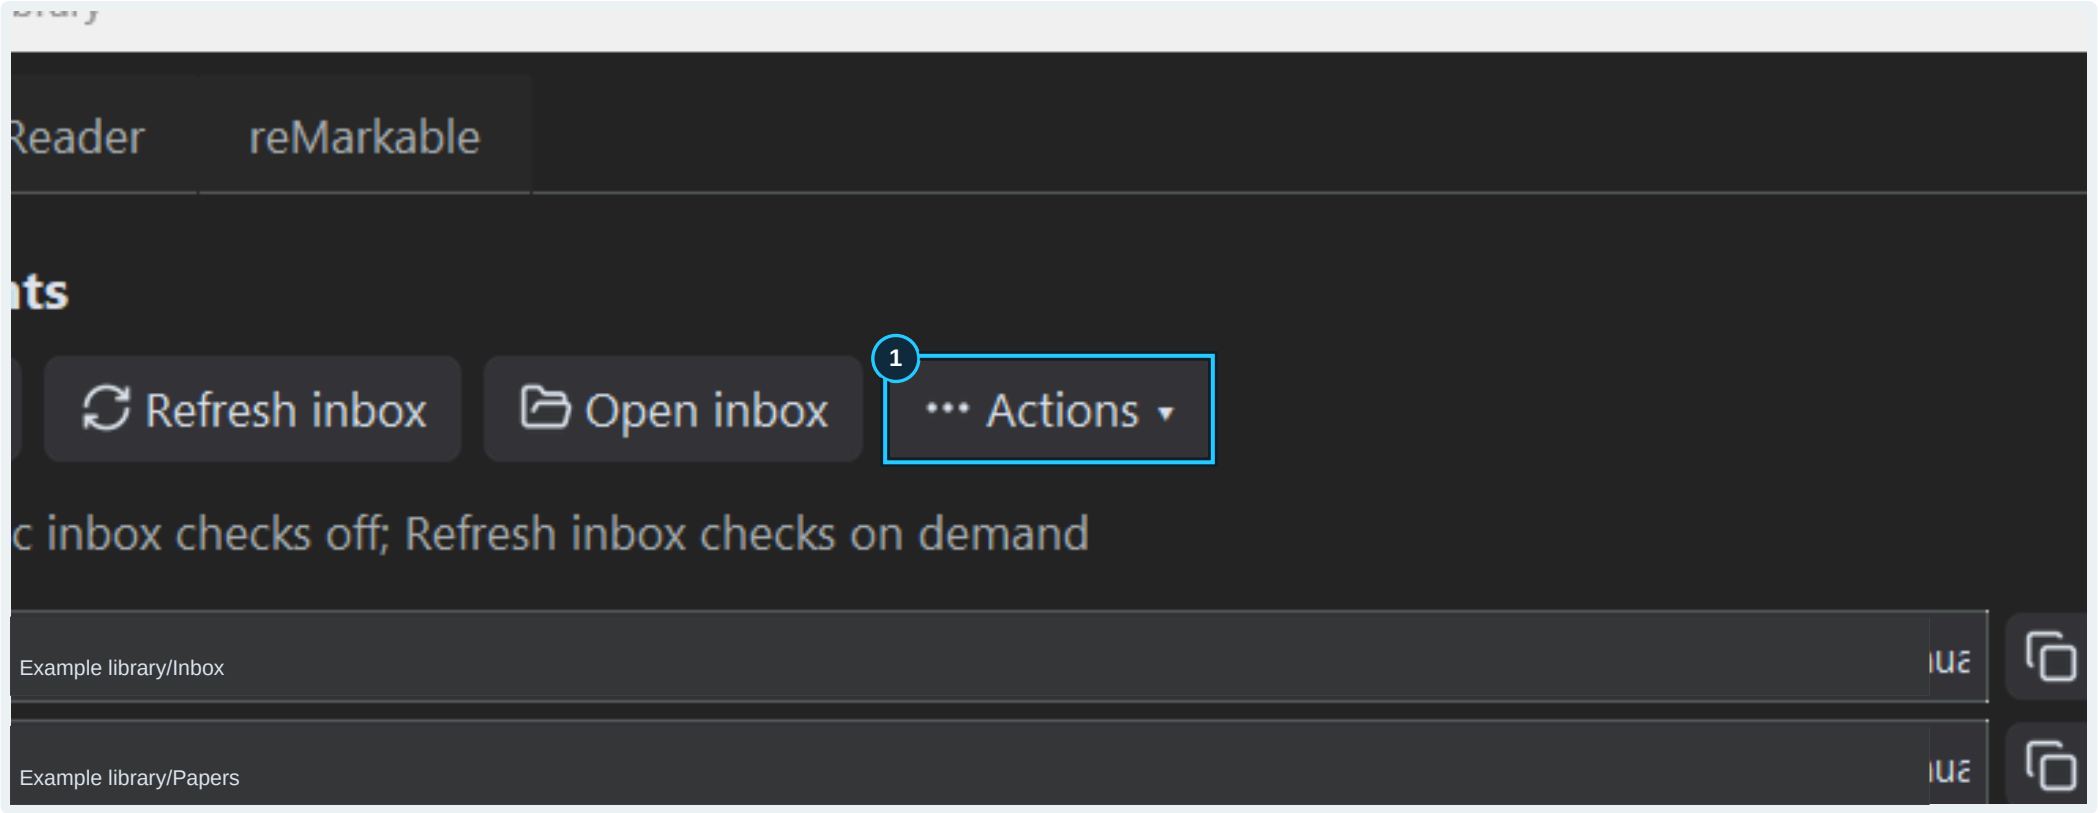

1. Retain the file and skip this review **2.** Retry only when offered

What to expect: Skipped items remain preserved. A file that changes must be refreshed and reviewed again before filing.

Skip, retry or recover an Inbox filing

2. For an interrupted filing, open Inbox → Actions → Filing recovery…. Inspect the source and destination locations in that window.

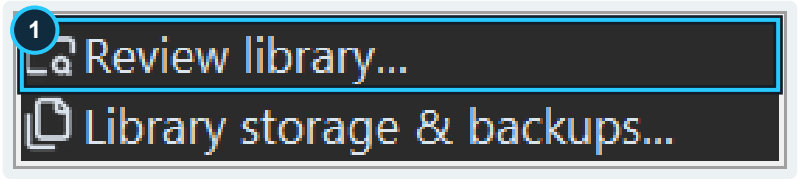

1. Open recovery and Inbox setup actions

What to expect: Notable retains recovery copies when safe completion cannot be proved. Compare both copies before making any manual deletion.

Check a library for duplicate papers

1. In Library, open Library actions and choose Review library….

Start here: Choose a limited PC folder first. Saved tablet information can be incomplete; connect and refresh folders when you want tablet comparisons.

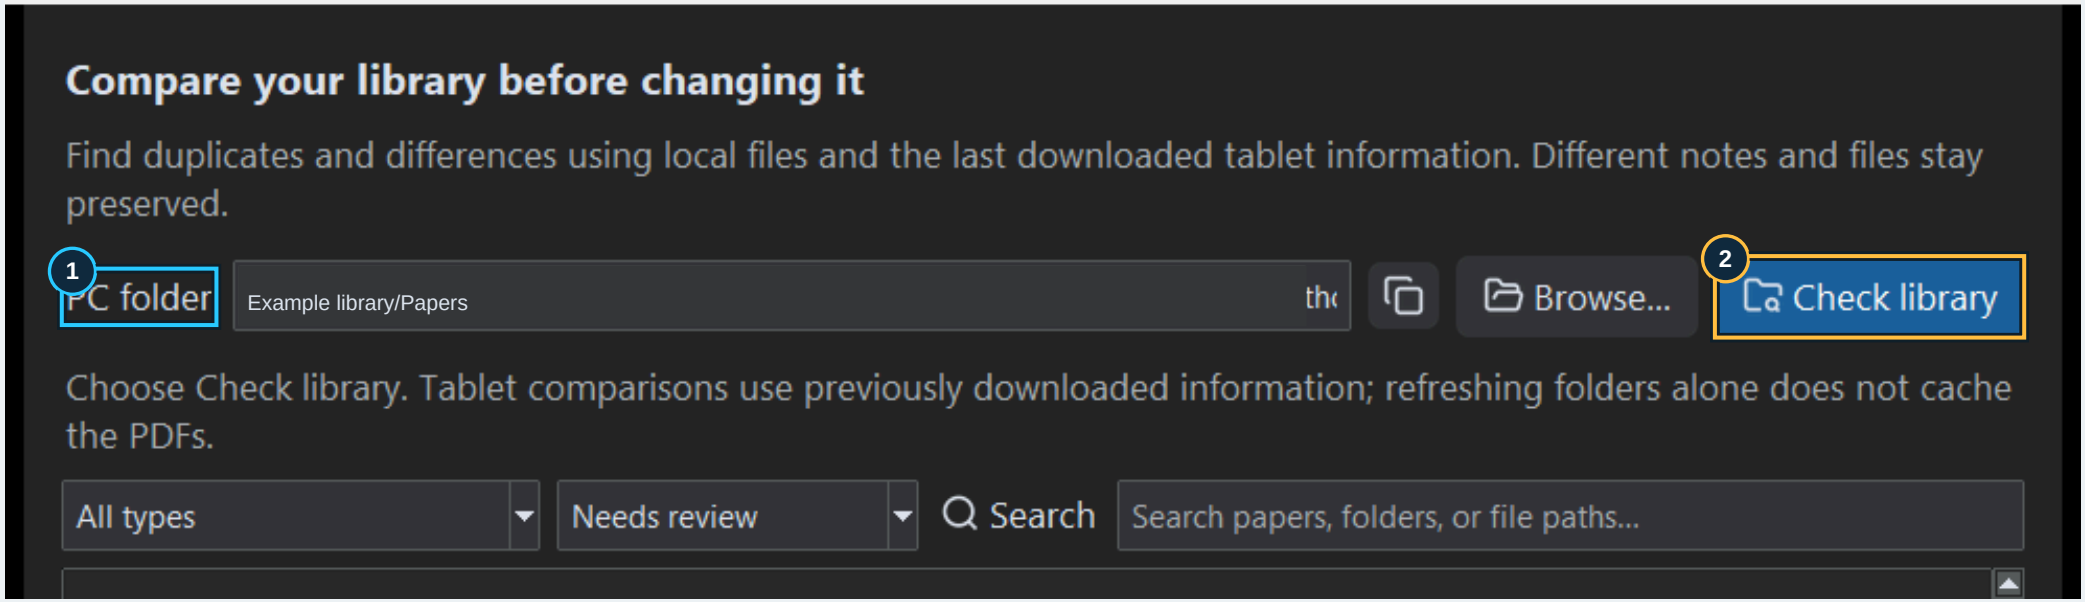

1. Open the comparison workflow

What to expect: The comparison window opens without changing any paper relationships.

Check a library for duplicate papers

2. Choose the PC folder with Browse… or the path field, then click Check library.

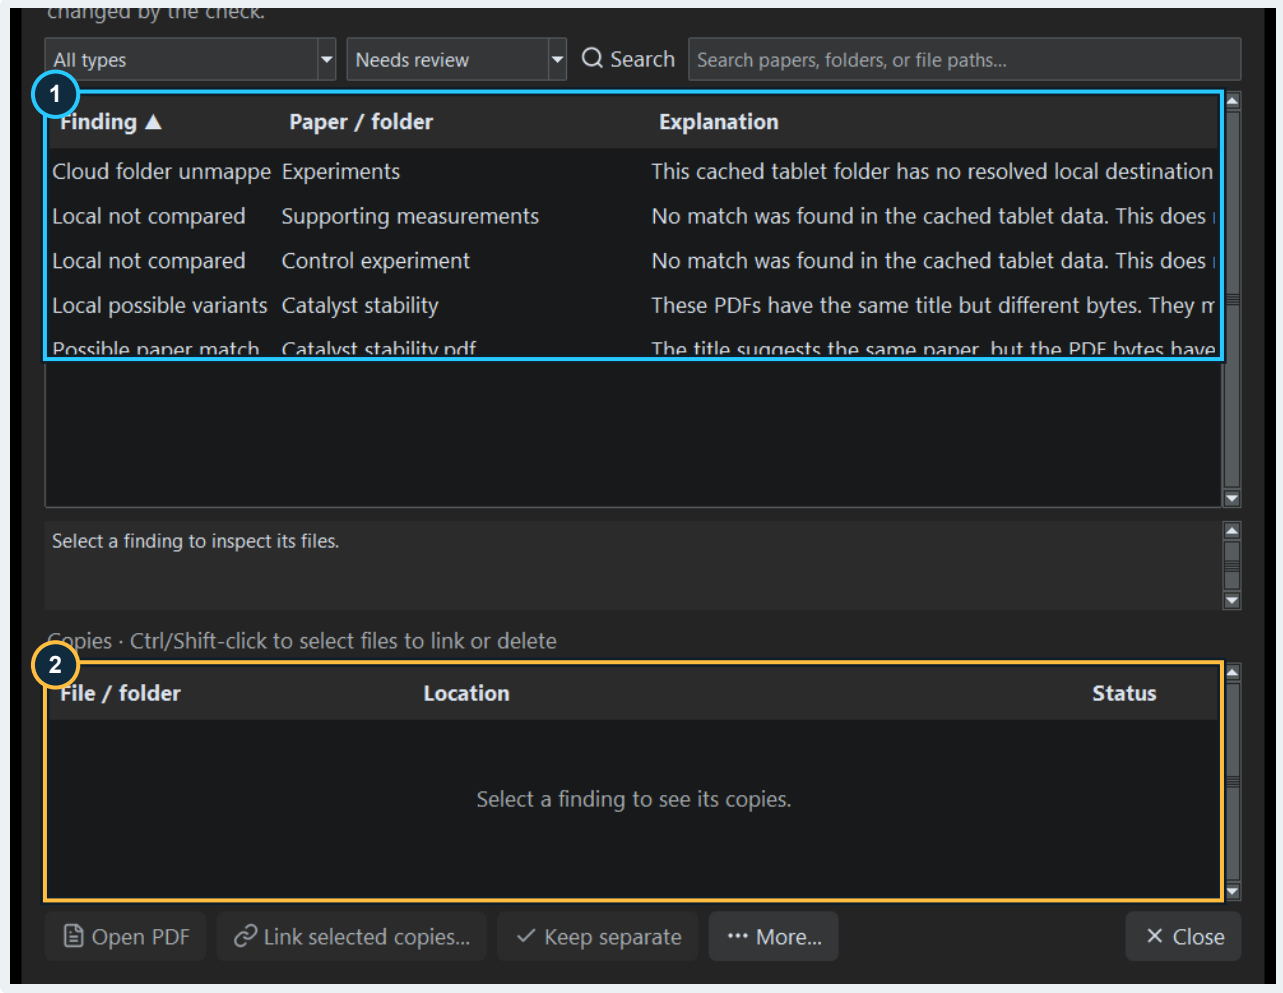

1. Choose the area to compare **2.** Start the comparison

What to expect: Checking placeholders appear inside both lists while the comparison is running. Findings appear when the check finishes.

Check a library for duplicate papers

3. Inspect the findings. Use the type/state filters, search field or column headings to narrow and sort them. Select one finding.

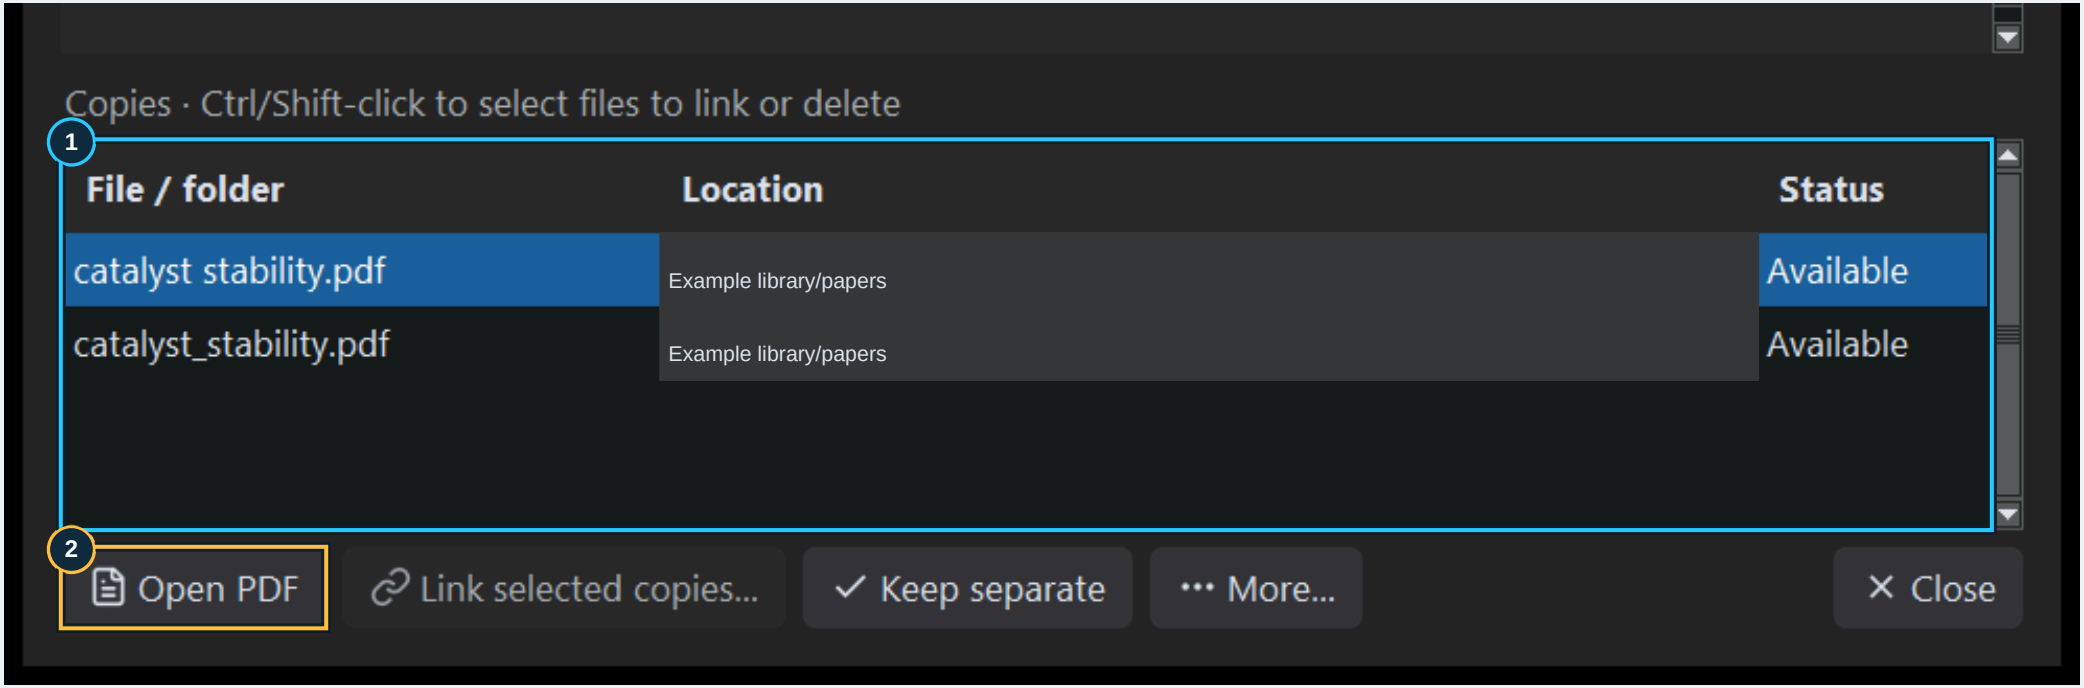

1. Select a finding to inspect **2.** Copies belonging to that finding

What to expect: The bottom list shows that finding's copies, with availability and locations. No match is linked merely because it appears in this list.

Link selected copies or keep papers separate

1. Select a finding and inspect its explanation and copies. Double-click a single local copy to open it for comparison.

Start here: Inspect titles, content, versions and locations first. Linking combines saved identity; it does not remove physical files.

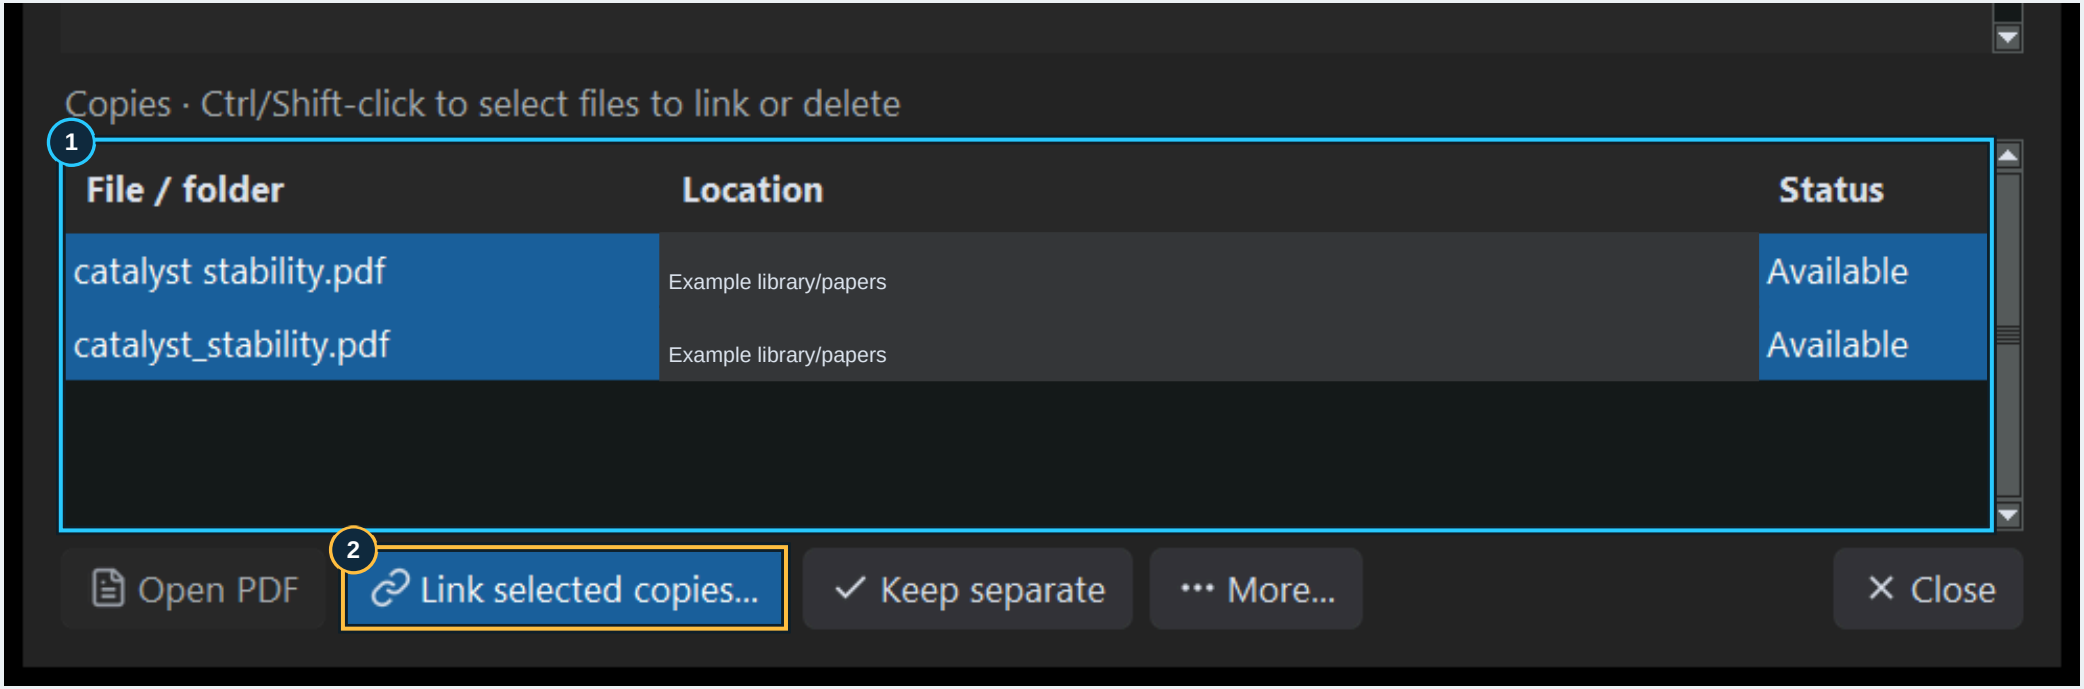

1. Inspect each source copy **2.** Open a single available selection

What to expect: The copy list identifies which files are actually available. Missing or uncertain sources require review.

Link selected copies or keep papers separate

2. Use Ctrl-click for individual copies or Shift-click for a range. Click Link selected copies… and read the exact-source confirmation before accepting.

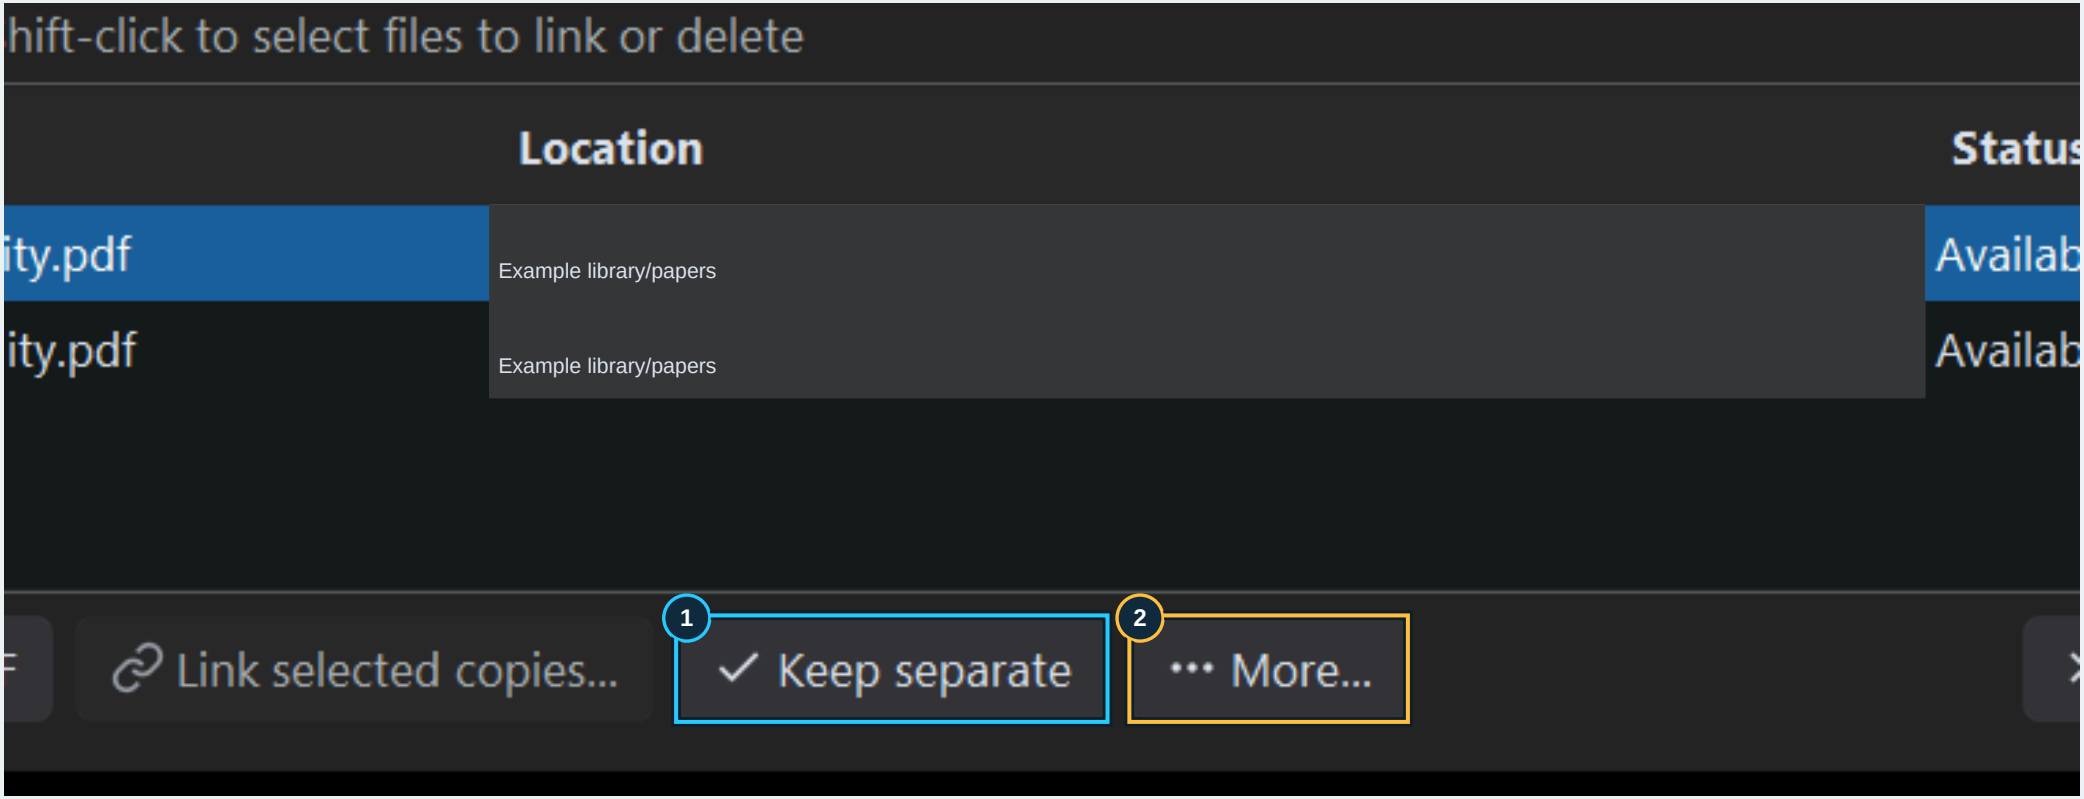

1. Ctrl/Shift selects the intended subset **2.** Review the exact copies before linking

What to expect: Only selected copies participate in the link. Independent annotations and history remain preserved; conflicting reviewed citations require an explicit citation choice.

Link selected copies or keep papers separate

3. If these papers should remain separate, click Keep separate instead. To revisit that decision, choose Review again from More…. Use Undo last link… to reverse the latest supported link.

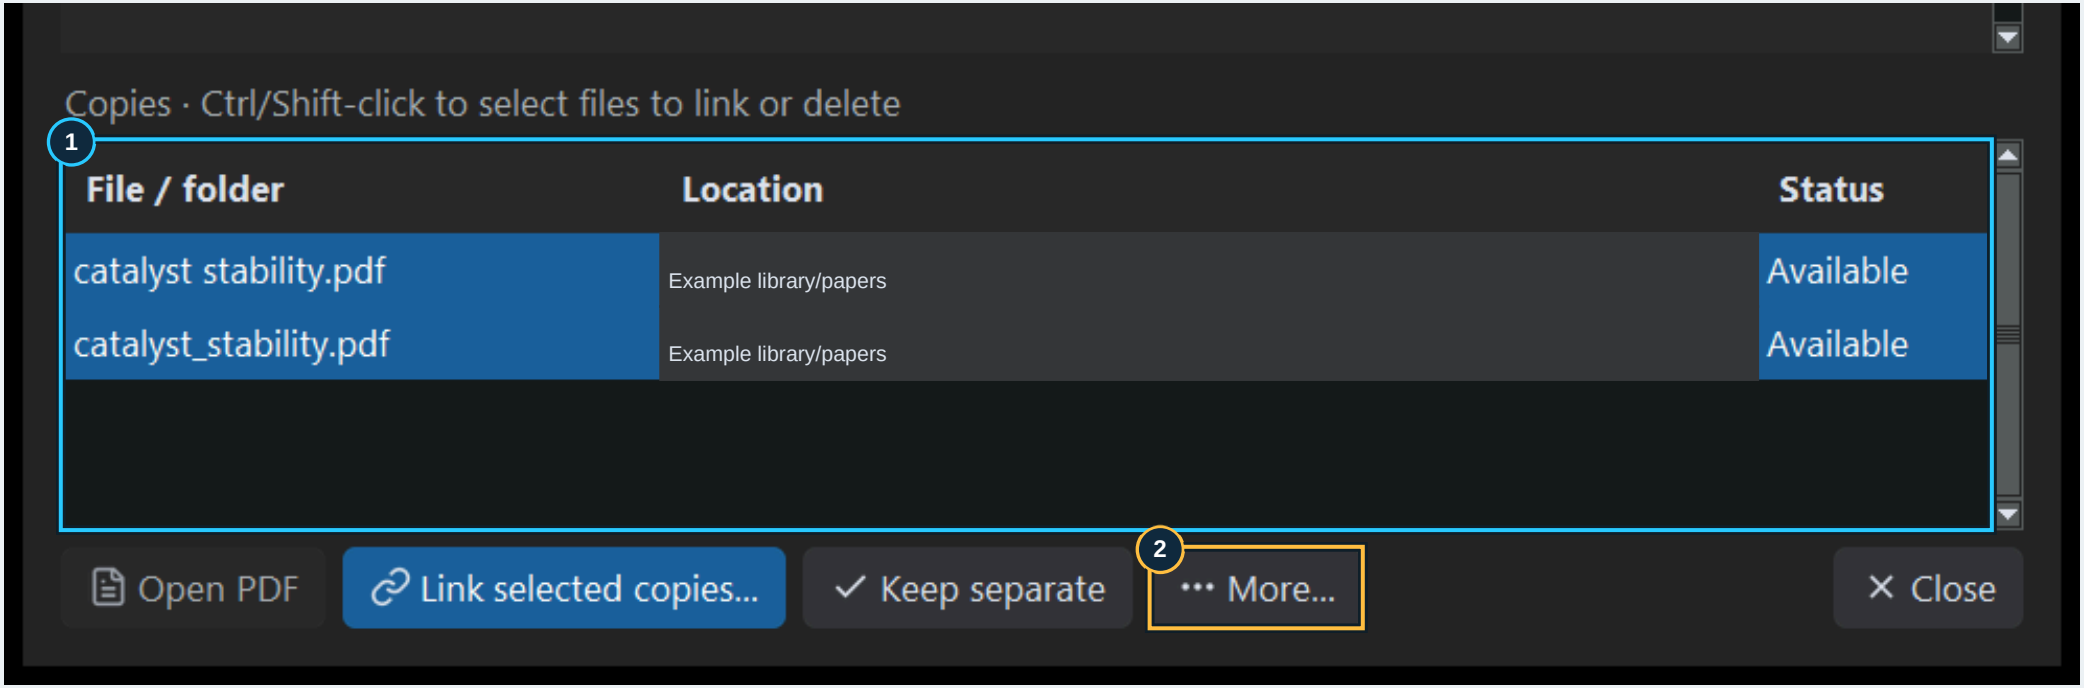

1. Remember a separate-paper decision **2.** Review again and Undo last link

What to expect: Keep separate remembers the decision; Review again makes it eligible for review. Undo affects the latest recorded link rather than deleting files.

Delete only reviewed local PDF copies

1. In the Copies list, Ctrl/Shift-select only the available local PDF files you intend to delete. Open More….

Start here: Select files deliberately. Deleting a physical copy is different from linking identities; saved notes remain preserved.

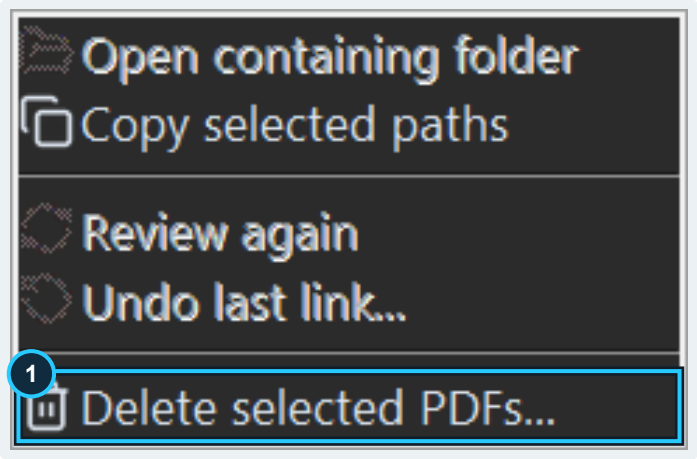

1. Choose the exact local subset **2.** Open reviewed file actions

What to expect: The delete action is enabled only when selected local PDFs can be safely reviewed within the checked root.

Delete only reviewed local PDF copies

2. Choose Delete selected PDFs…. Read the confirmation’s complete file list and preserved-note explanation, then confirm or cancel.

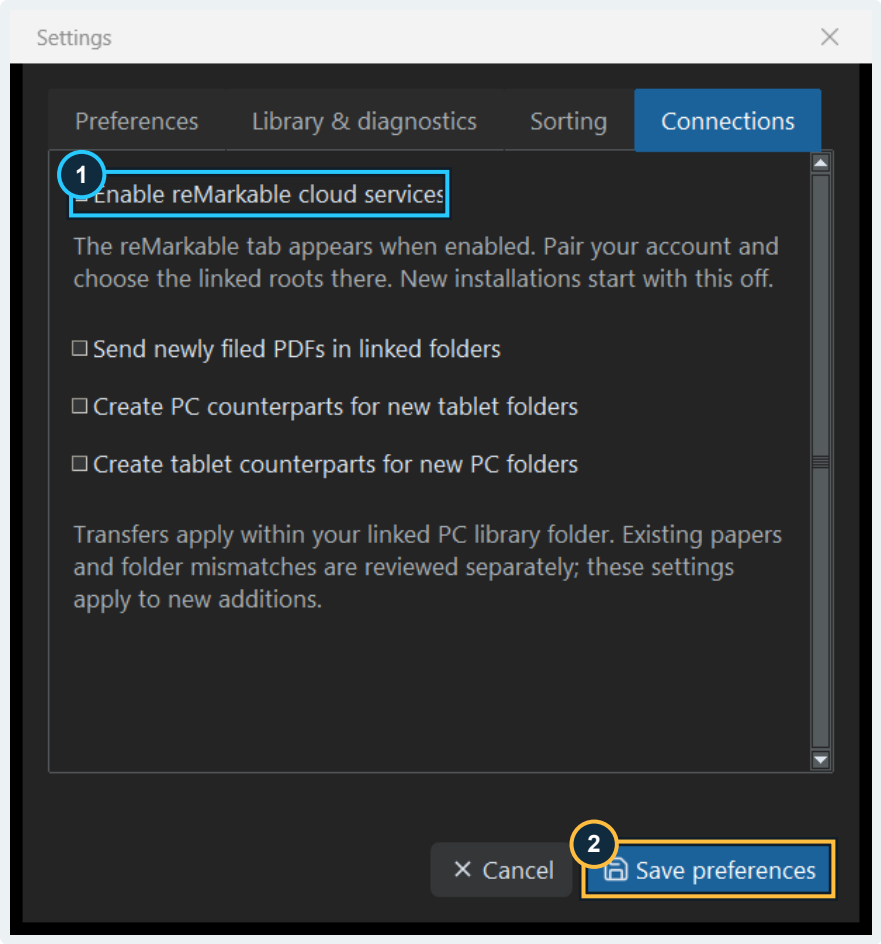

1. Review the exact files before deletion

What to expect: Only the confirmed selected local files move to the Windows Recycle Bin. Any partial failure is reported; inspect the result before another attempt.

Enable and pair reMarkable

1. Open Settings → Connections. Enable reMarkable cloud services and click Save preferences.

Start here: Cloud services are optional. Keep them disabled for a PC-only library. Pairing requires your own reMarkable account.

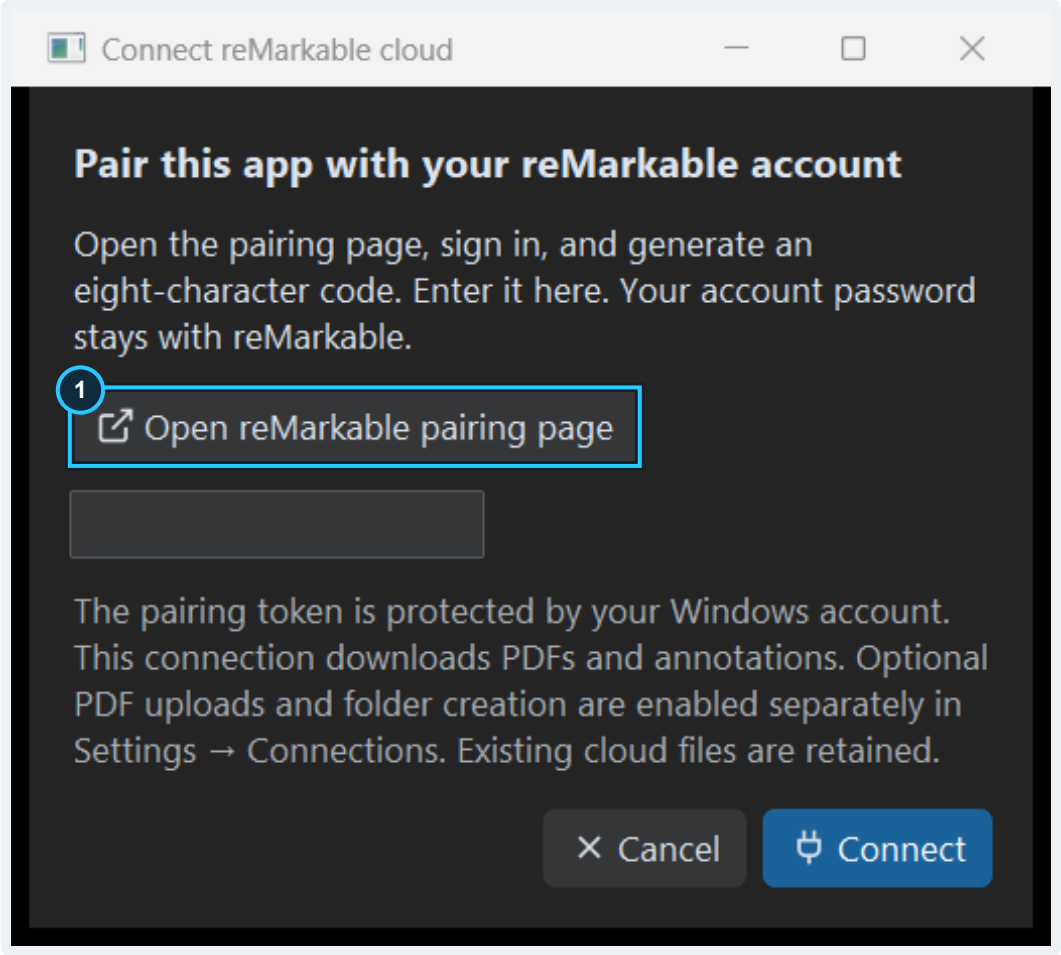

1. Reveal the optional connection **2.** Save the connection setting

What to expect: The reMarkable tab becomes available. Sending PDFs and creating folders have separate switches; enabling cloud services alone does not authorize those optional behaviors.

Enable and pair reMarkable

2. On the reMarkable tab, choose Connect reMarkable… (or Connection → Reconnect…). Click Open reMarkable pairing page, sign in there and generate an eight-character code.

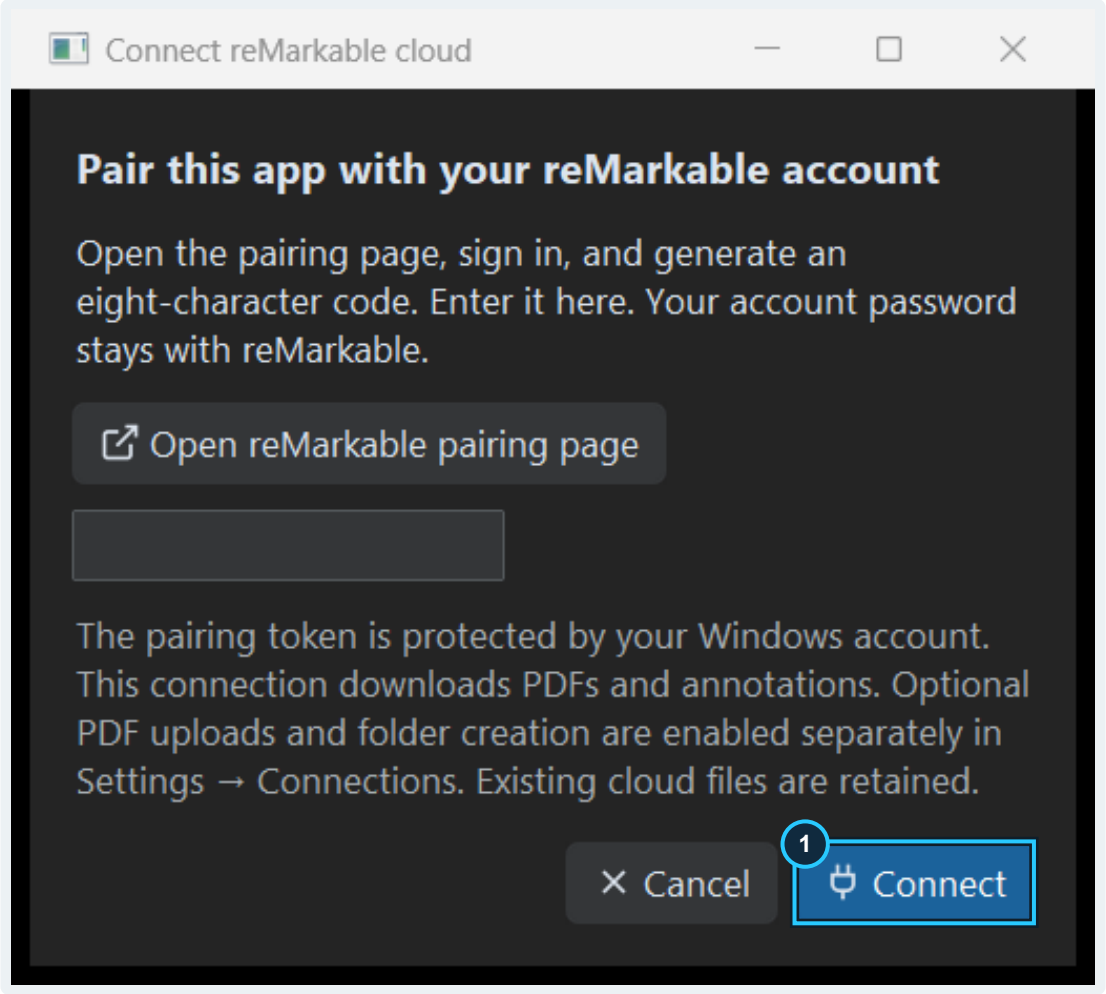

1. Generate your one-time code

What to expect: Your account password stays on reMarkable's site. Return to this dialog with the one-time code.

Enable and pair reMarkable

3. Enter the eight-character code in the field and click Connect.

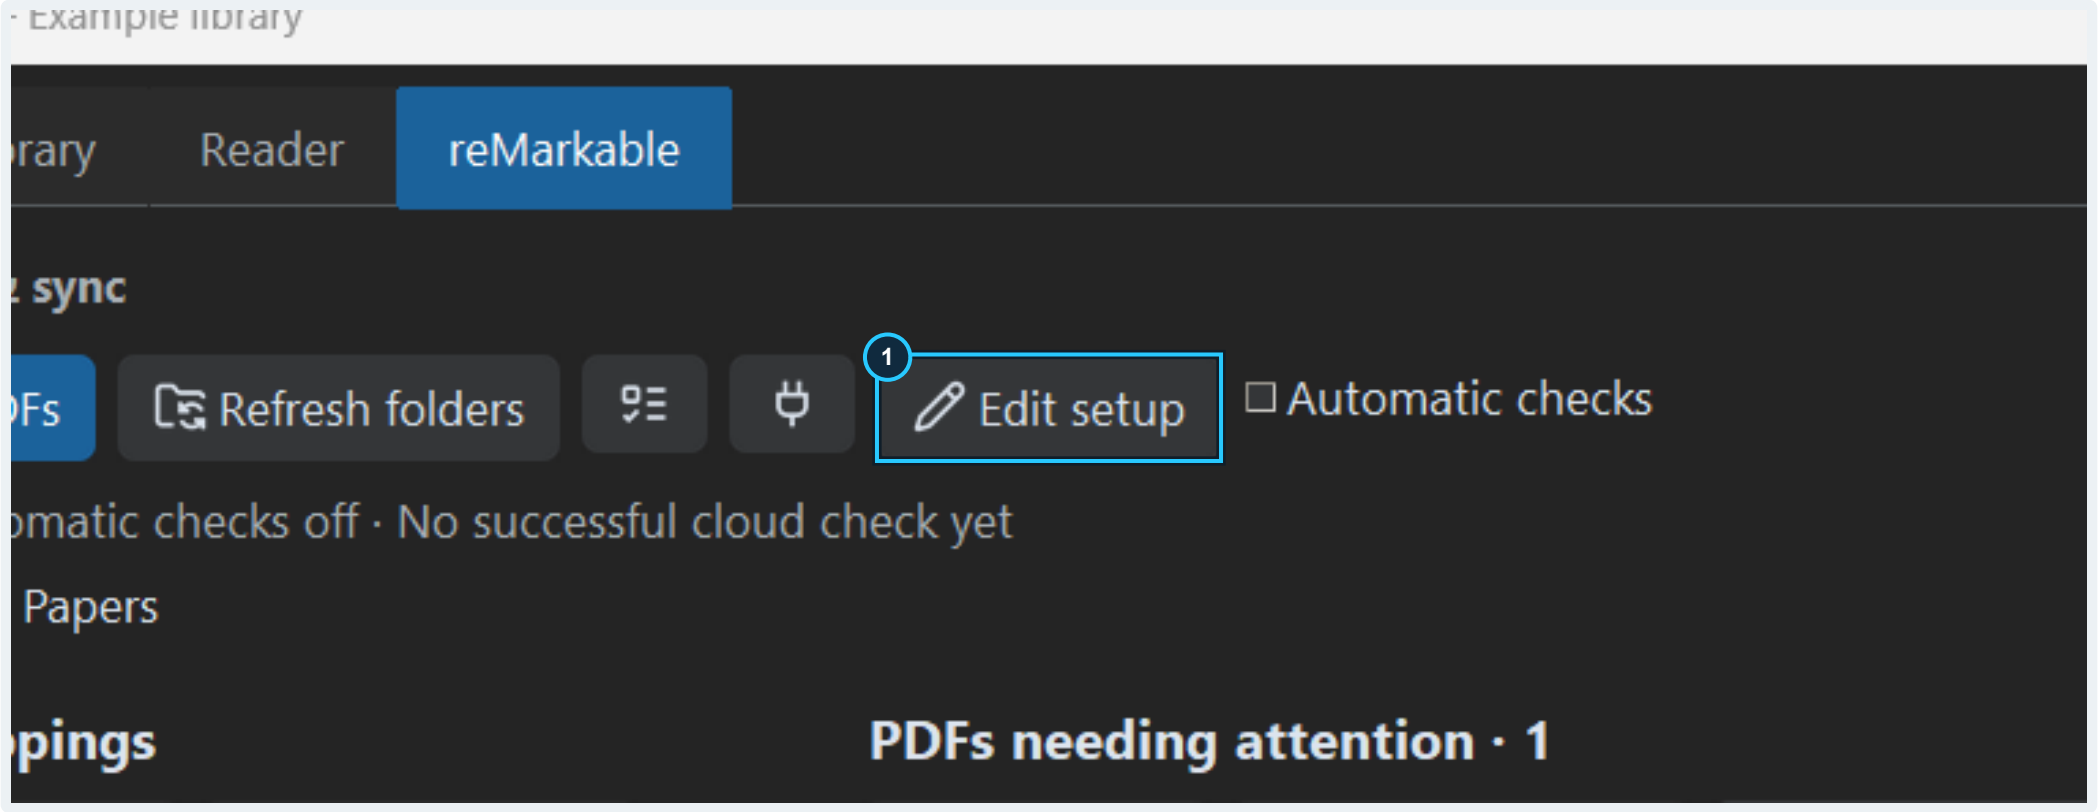

1. Pair using the entered code

What to expect: The pairing token is protected by your Windows account. The manual's tablet screens use an offline example catalog; no real account is included.

Choose tablet sync roots

1. Click Edit setup in the reMarkable tab.

Start here: Begin with one limited tablet source and its existing PC counterpart. Review the scope before syncing.

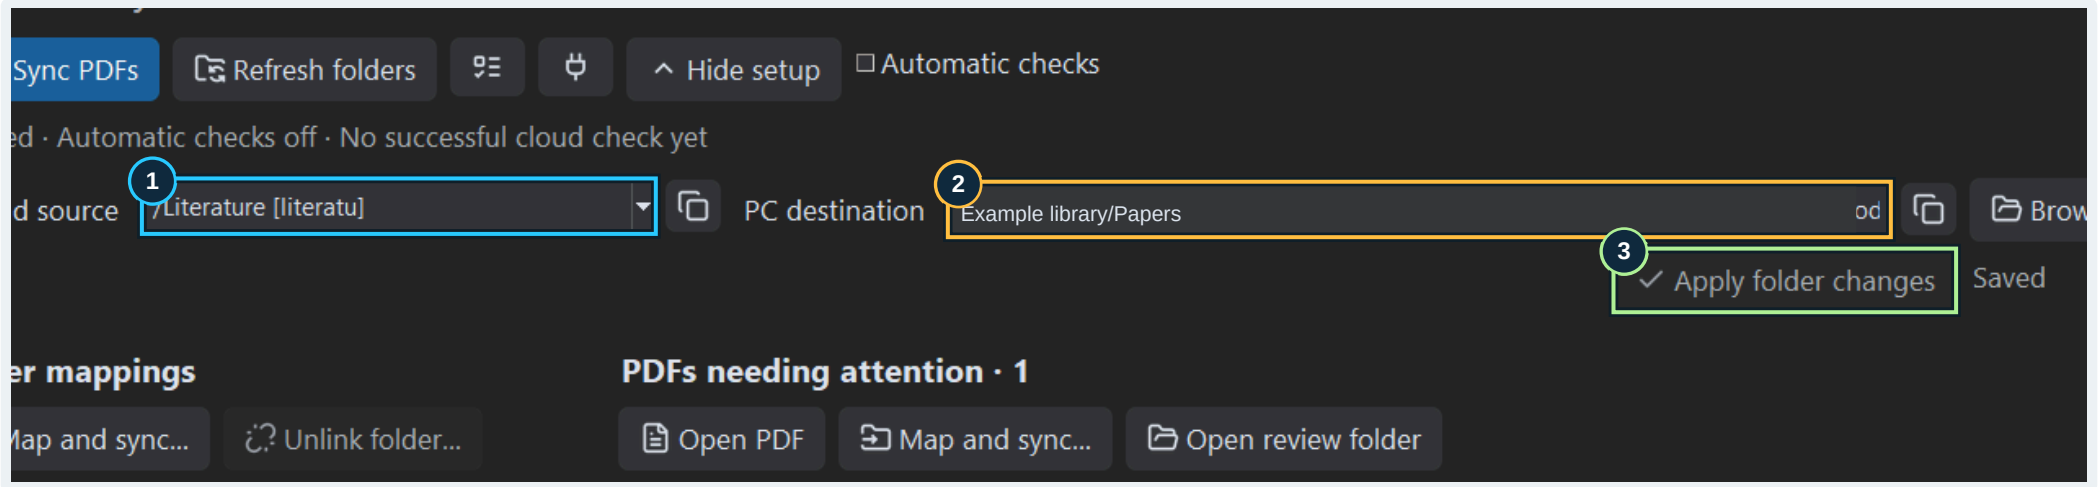

1. Inspect both sync roots

What to expect: The cloud source and PC destination fields become visible.

Choose tablet sync roots

2. Choose the Cloud source and PC destination, then click Apply folder changes.

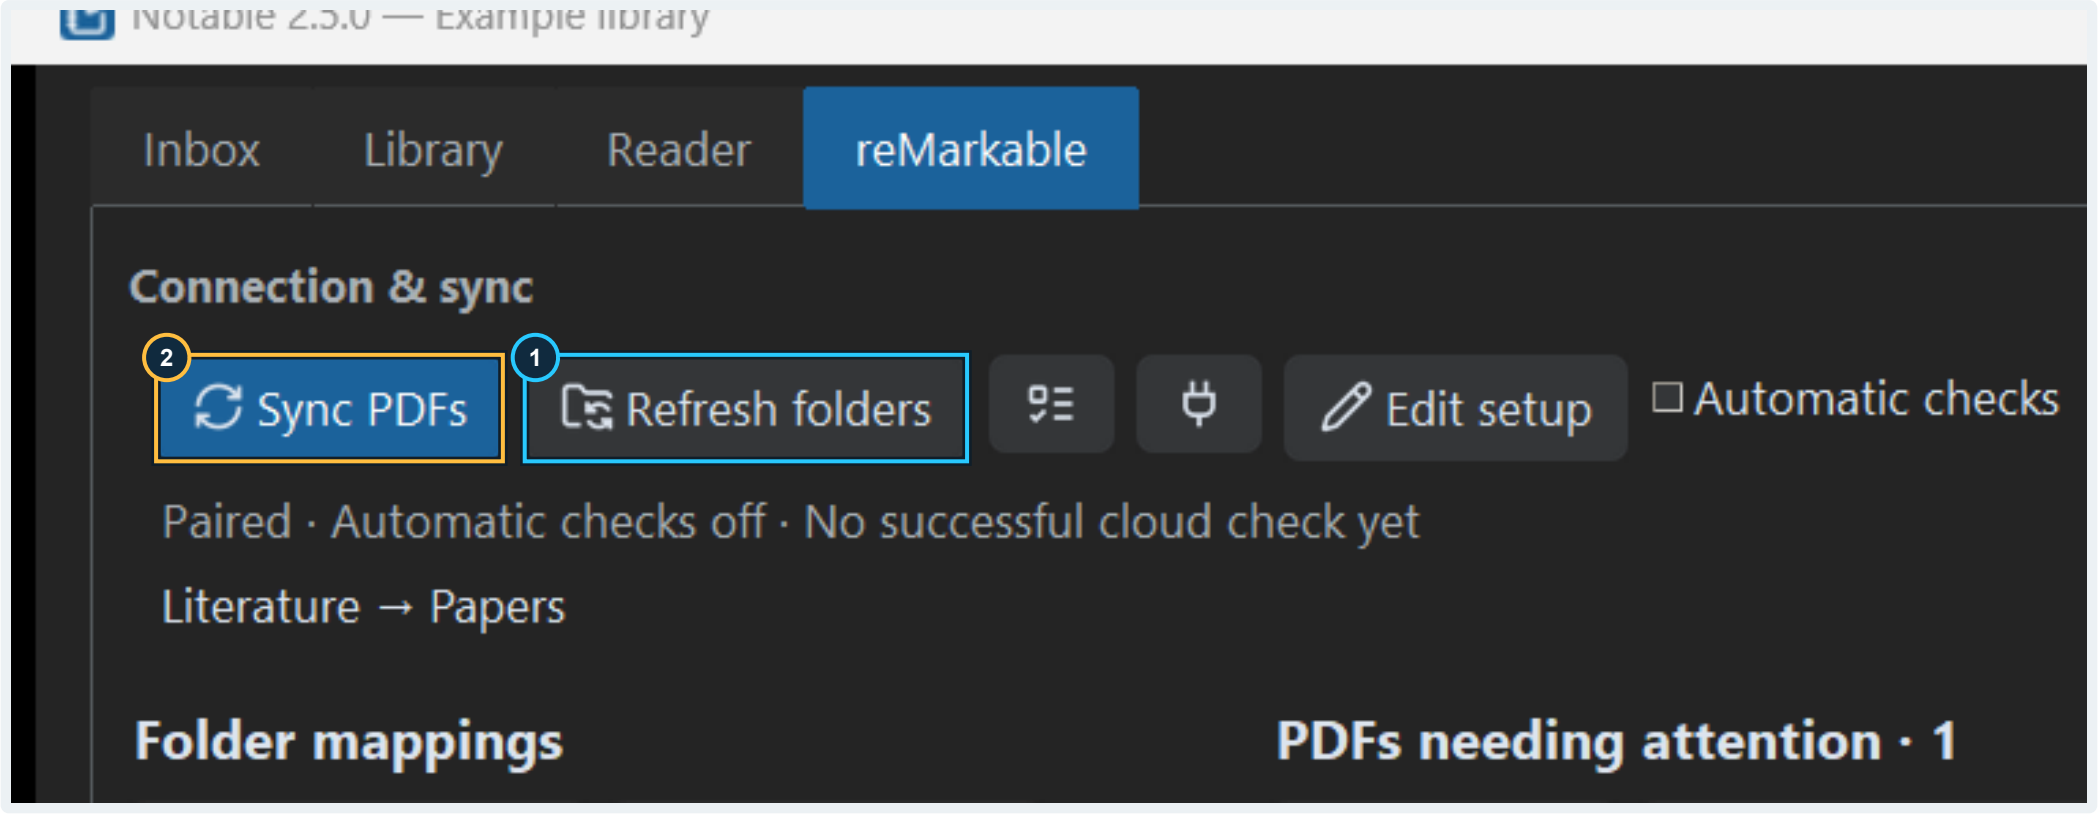

1. Limit the tablet source **2.** Choose its PC counterpart **3.** Save the reviewed routing

What to expect: The selected source maps directly to that PC root. Automatic Literature selection requires exactly one suitable Literature folder.

Choose tablet sync roots

3. Click Refresh folders to update the catalog without downloading PDFs. Click Sync PDFs when you are ready to download changed PDFs and process enabled work.

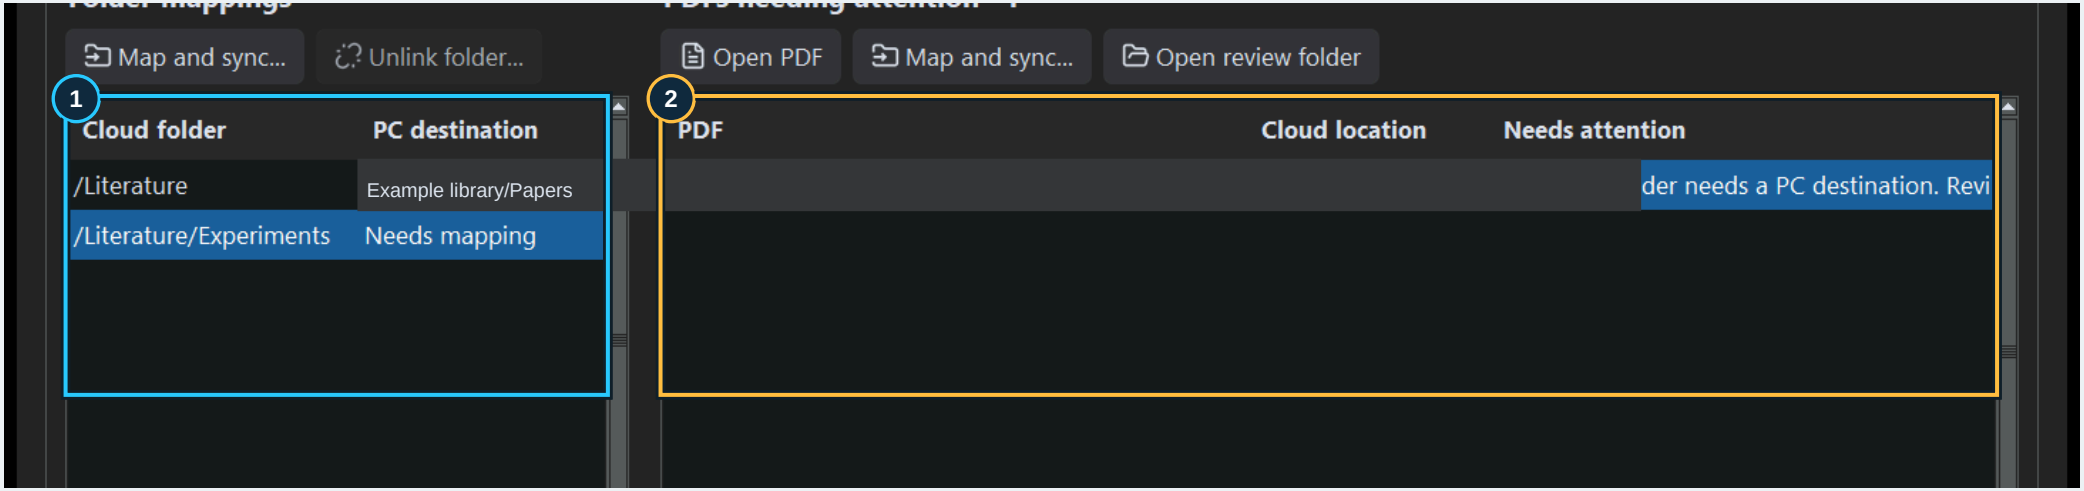

1. Refresh tablet folder information **2.** Run a deliberate cloud check

What to expect: Automatic checks run every five minutes while the app is open when enabled. Turning them off pauses periodic downloads; separate enabled upload/folder queues have their own behavior.

Map a folder or handle a tablet PDF needing attention

1. Select the tablet folder under Folder mappings, or the retained PDF under PDFs needing attention. Inspect its complete locations and explanation.

Start here: Map connects one tablet folder to an existing PC counterpart. It does not resolve PDF conversion errors or local version conflicts by itself.

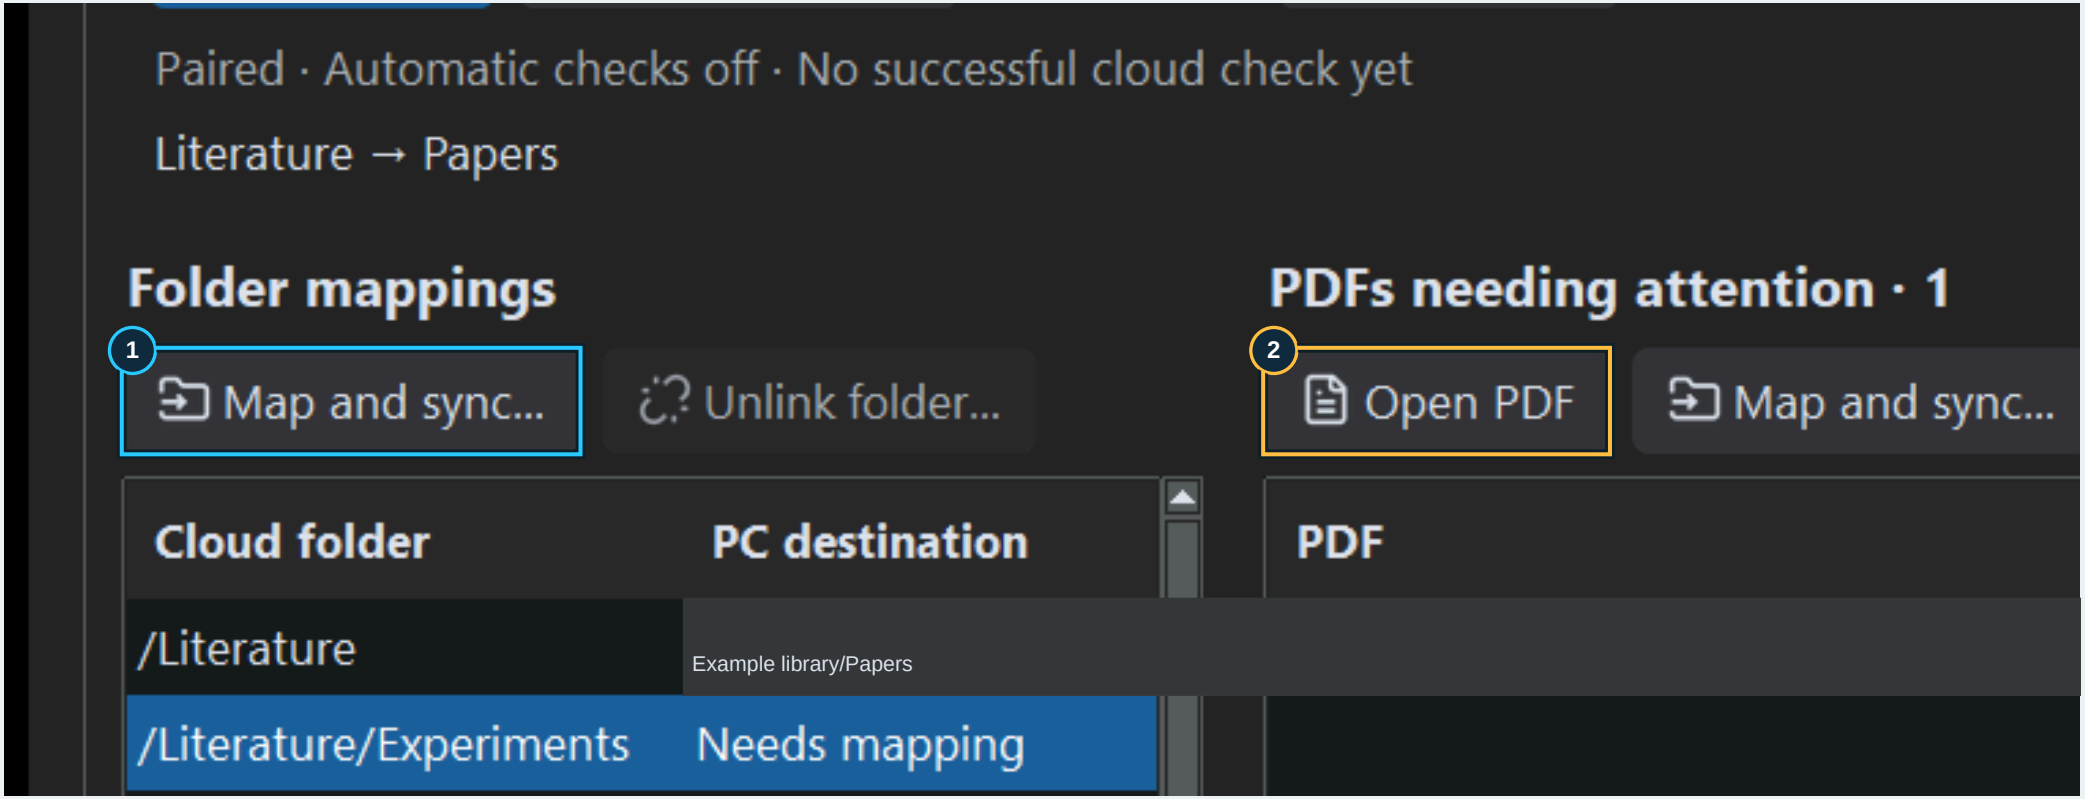

1. Select the tablet folder **2.** Inspect retained PDFs needing review

What to expect: The contextual Map and sync… action is available when a mapping can resolve this item.

Map a folder or handle a tablet PDF needing attention

2. Click Map and sync…. In the Windows chooser, read the tablet folder named in the dialog title and select its intended existing PC folder.

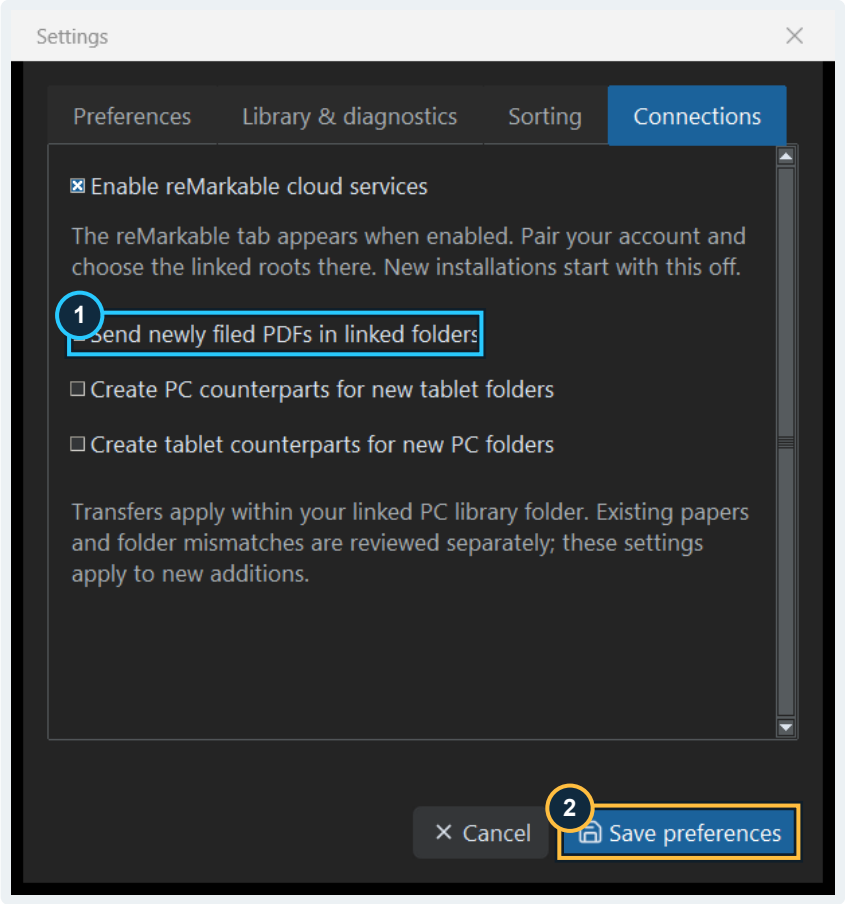

1. Map the selected tablet folder **2.** Inspect a retained local PDF

What to expect: Notable saves the folder link and starts enabled sync work. Review the updated mapping and any remaining explanation. Use Open PDF for a retained download that needs inspection.

Send a PDF and review its transfer

1. Enable Send newly filed PDFs in linked folders if you want that behavior, then Save preferences. Enable folder creation only when you want those separate capabilities.

Start here: Enable PDF sending in Settings → Connections and establish the matching PC/tablet route first. Uploads are explicit for existing library papers.

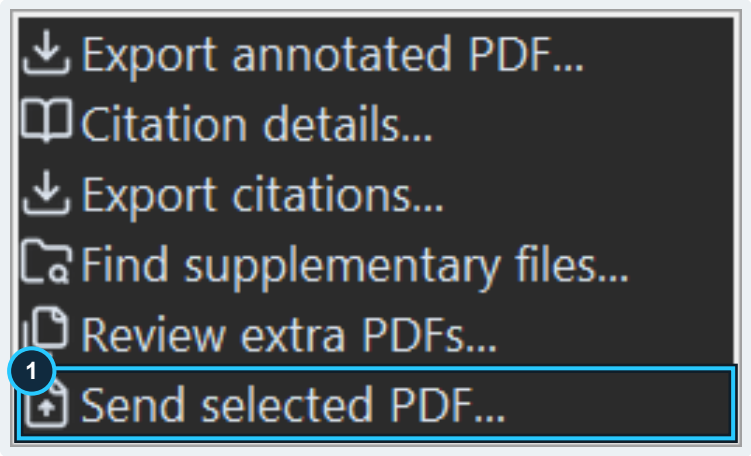

1. Optional sending permission **2.** Save reviewed capabilities

What to expect: Only eligible linked destinations are used. Existing cloud files are retained; unrelated destinations are not chosen to bypass a missing mapping.

Send a PDF and review its transfer

2. Select an existing Library paper, choose Actions → Send selected PDF…, and review the named file and tablet destination before confirming.

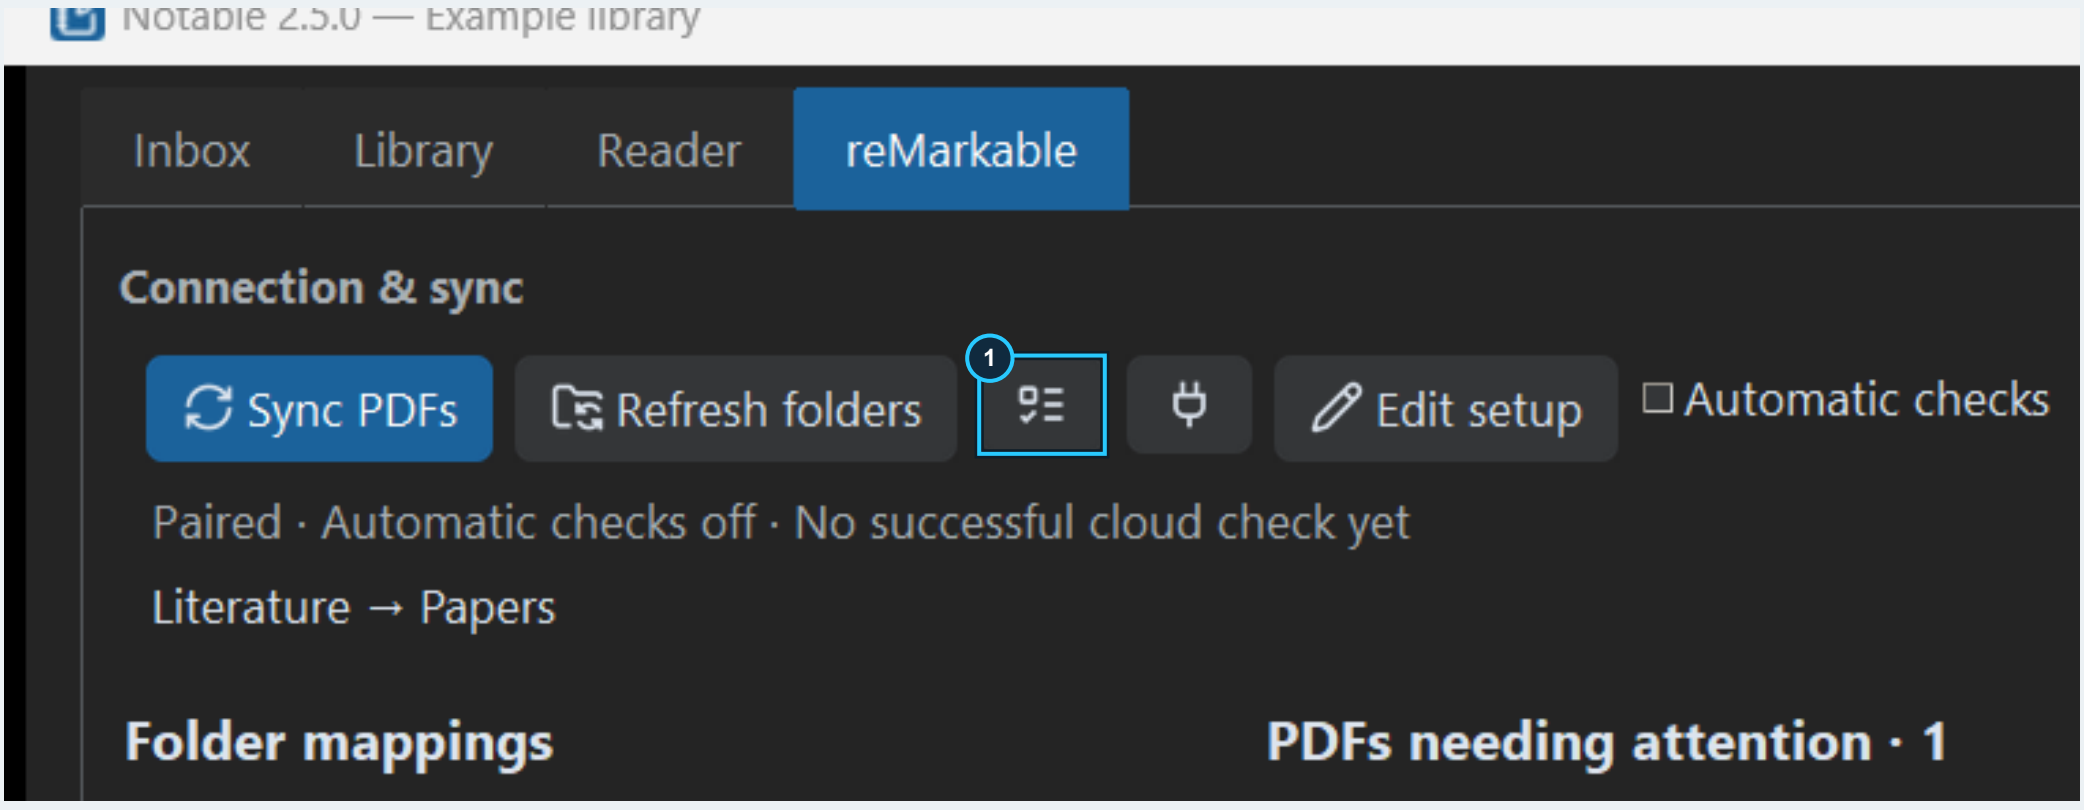

1. Review an explicit existing-paper transfer

What to expect: The original PDF is queued for the linked destination. Sending does not upload a generated Word notebook or an unrelated Office file.

Send a PDF and review its transfer

3. Click Transfer queue… to inspect pending, completed and paused transfers.

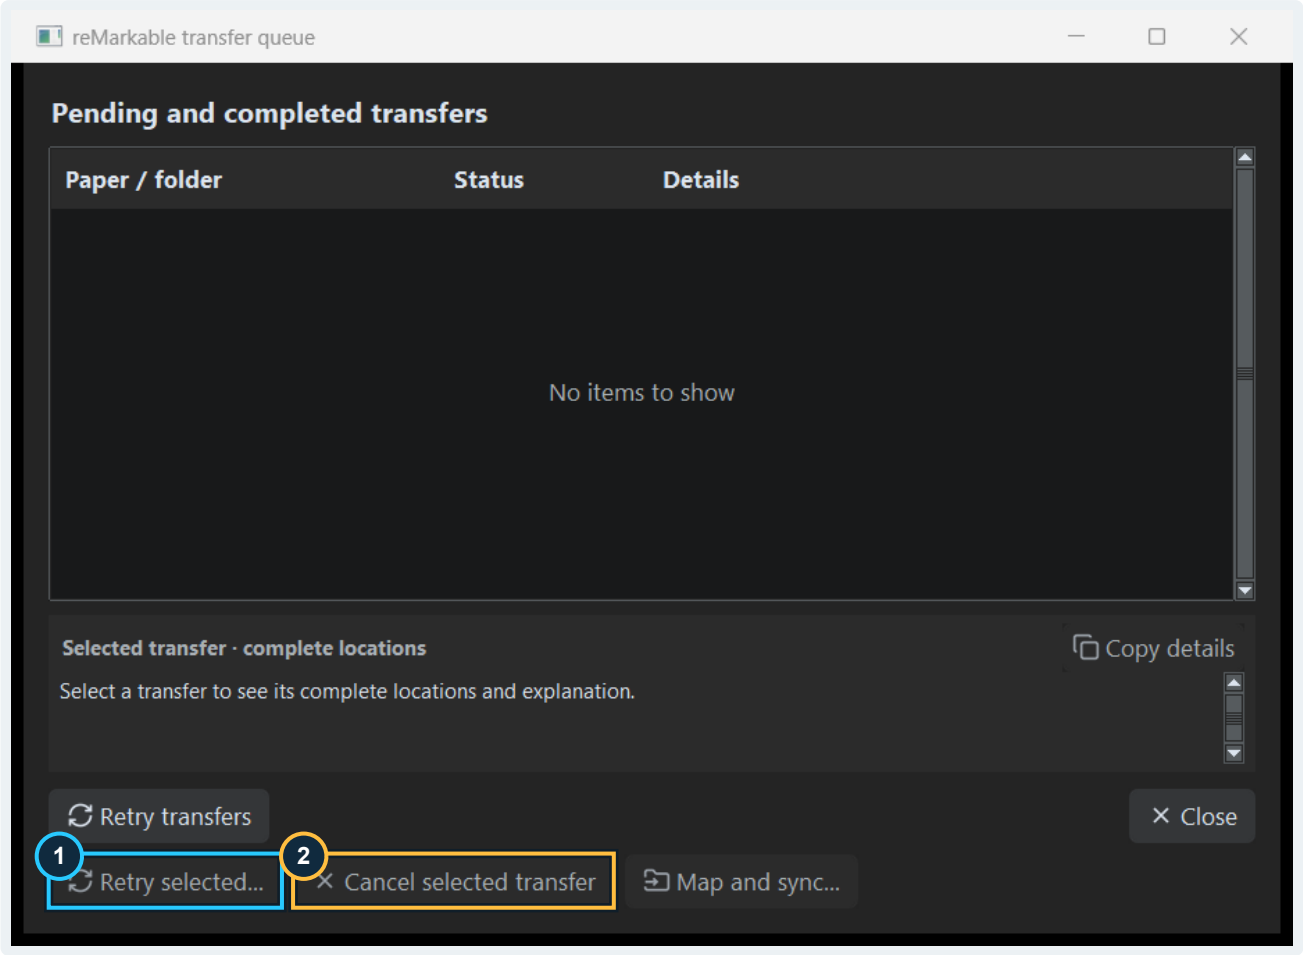

1. Inspect saved transfer work

What to expect: The queue retains transfer status and explanations after the window closes.

Send a PDF and review its transfer

4. Select a transfer to inspect its complete locations. Correct a missing mapping or changed file, then use Retry selected…; use Cancel selected transfer to stop future attempts.

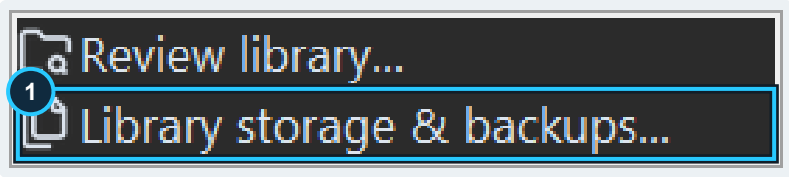

1. Review a changed transfer before retry **2.** Stop future attempts for the selection

What to expect: Retry selected asks you to accept the current file and destination. Cancellation preserves local files and anything already uploaded. Retry transfers attempts other eligible queued work.

Create and verify a library backup

1. Choose Library storage & backups….

Start here: Use Library actions → Library storage & backups…. A library backup and your independently stored research PDFs serve different purposes.

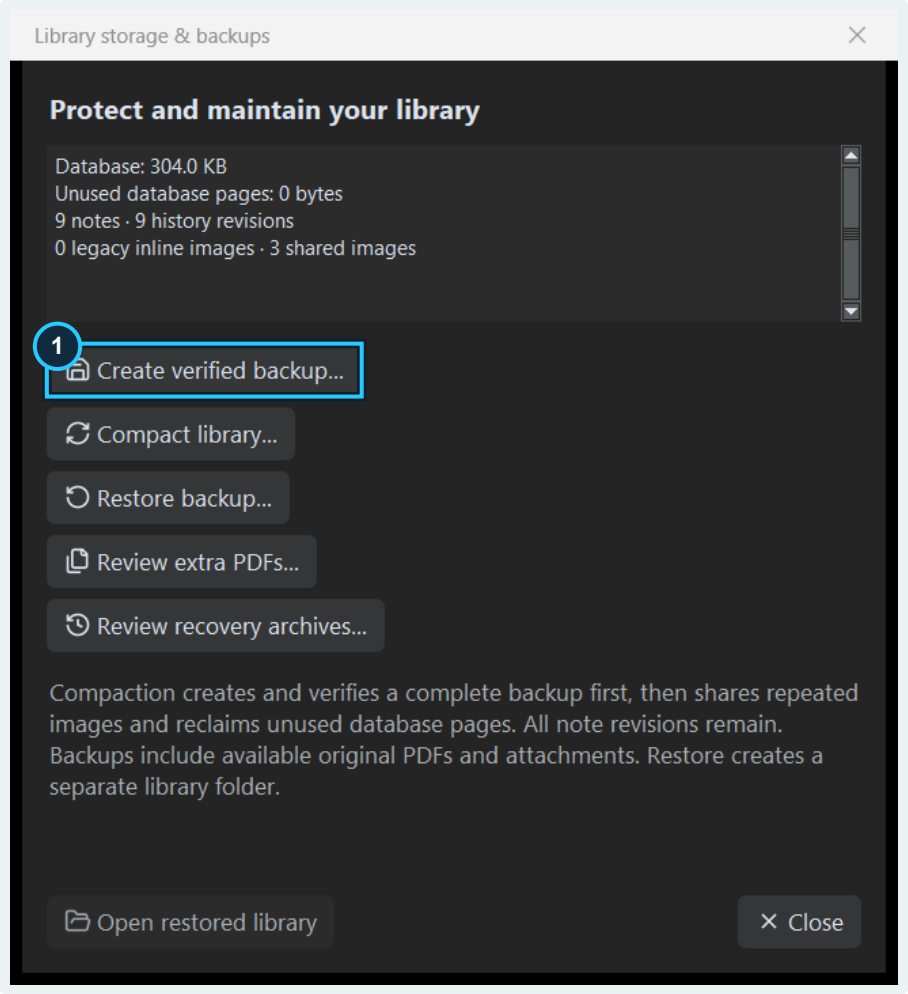

1. Open maintenance tools

What to expect: The storage dialog measures the saved library and exposes backup, restore, compaction and copy-review actions.

Create and verify a library backup

2. Click Create verified backup…, choose a new .zip filename and wait for verification to finish.

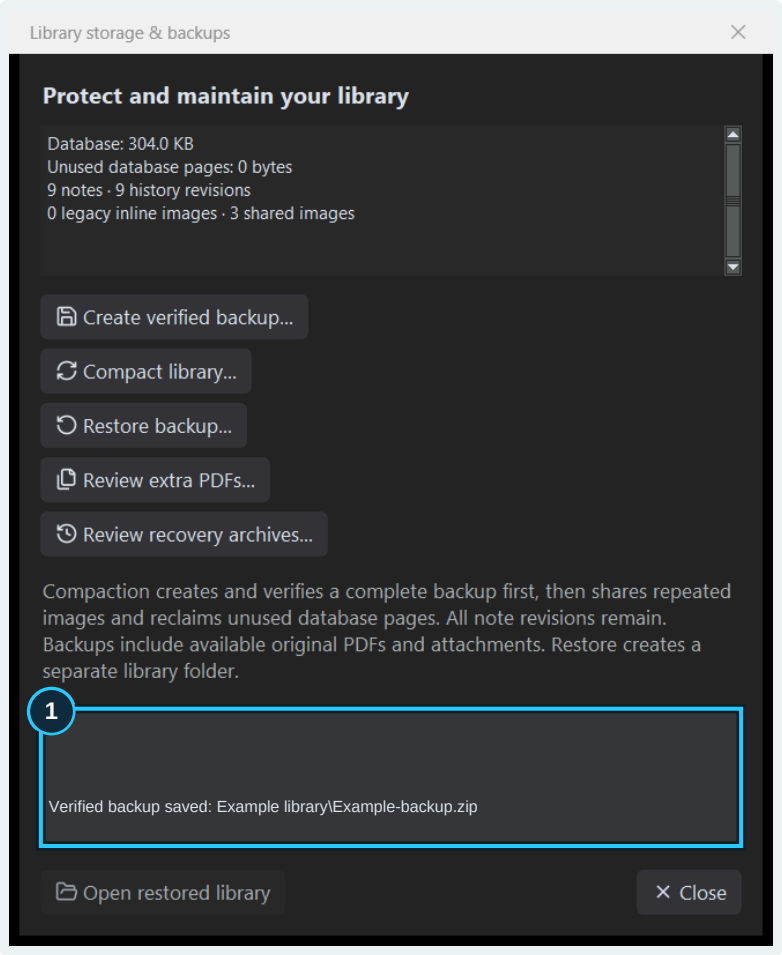

1. Choose a new backup archive

What to expect: Controls stay disabled while the backup is written and verified. Keep the completed archive in your chosen backup location.

Create and verify a library backup

3. Check that the status says Verified backup saved and identifies your archive. Also back up your research folder and editable Word writing separately.

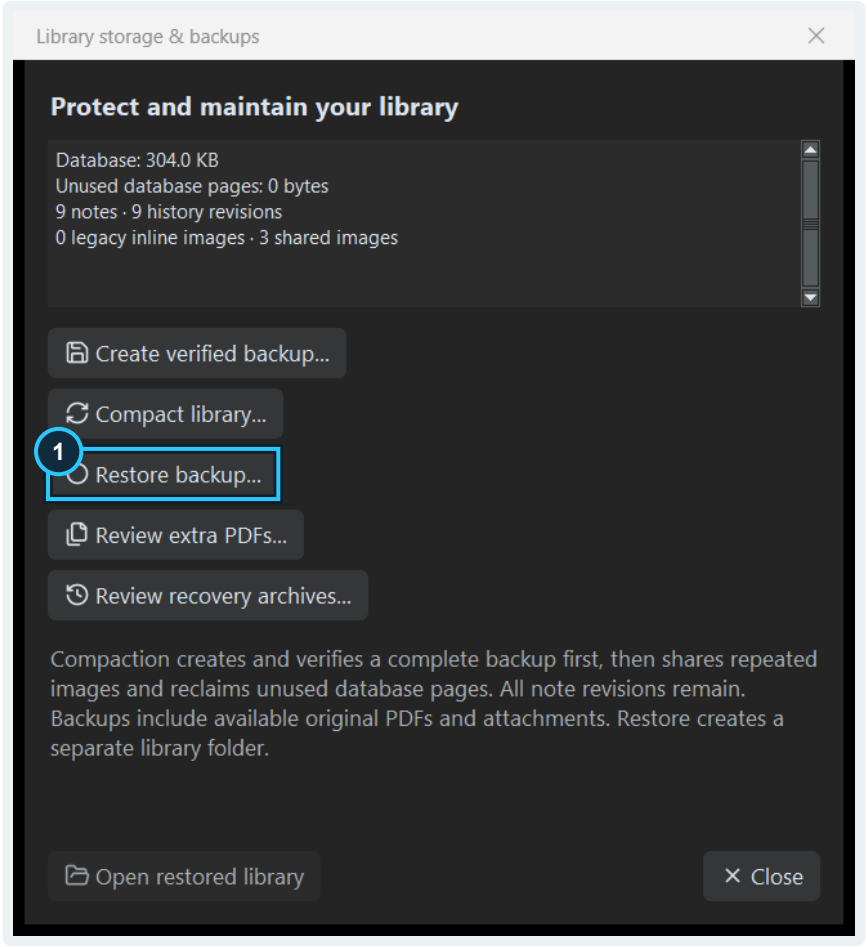

1. Verified completion identifies the saved archive

What to expect: The backup contains saved library data and managed source snapshots. It does not substitute for a separate backup of every externally stored research document.

Restore a backup into a separate library

1. Click Restore backup…. Choose the backup .zip, then the parent folder where a new restored library should be created.

Start here: Start from Library storage & backups. Restore creates a separate recovered library instead of overwriting the one currently open.

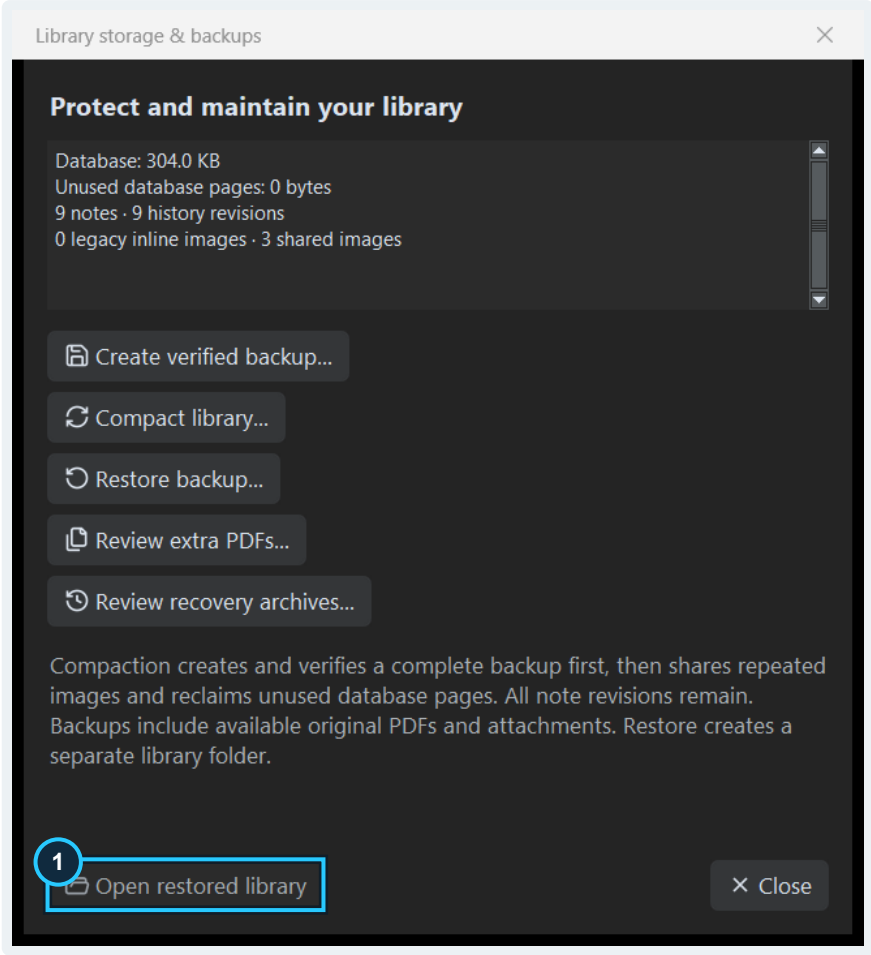

1. Select the archive and recovery parent

What to expect: Notable verifies the archive and creates a new Notable-restored-… folder beneath that parent.

Restore a backup into a separate library

2. After the verified restore finishes, click Open restored library. In that new app window, inspect Settings and the recovered papers before enabling automation.

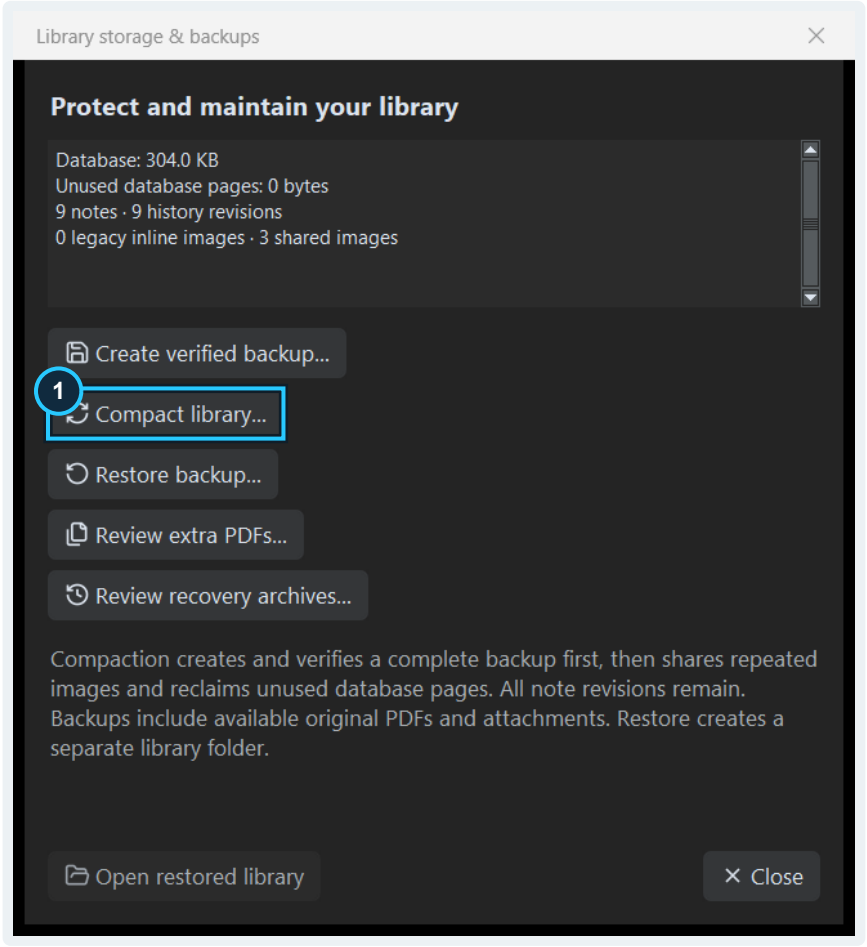

1. Enabled after a successful restore

What to expect: The recovered library opens separately with its own source snapshots. Inbox watching and cloud services start paused for setup review.

Compact storage or review old app copies

1. Click Compact library… and choose a new backup filename. Wait for the complete verified backup and compaction to finish.

Start here: These operations concern app-managed storage, not arbitrary PDFs you downloaded or wrote.

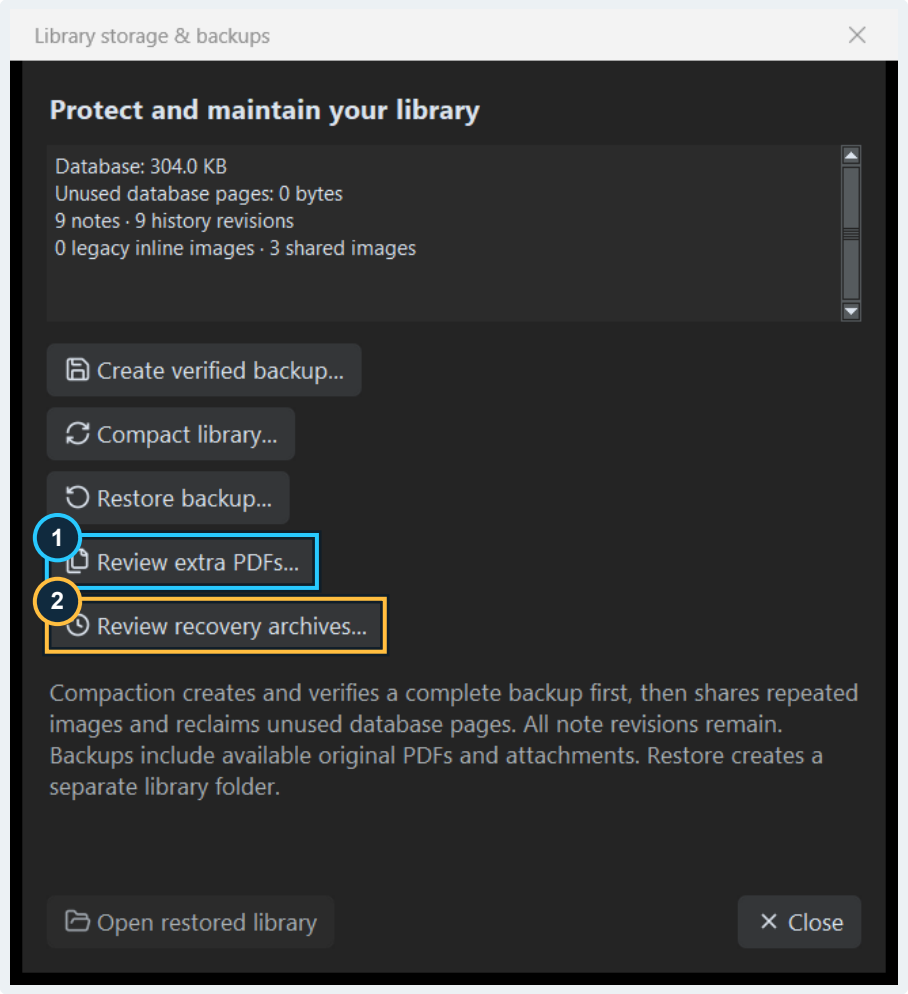

1. Back up, then compact safely

What to expect: Compaction shares repeated images and reclaims unused database pages while retaining notes and history.

Compact storage or review old app copies

2. For older reading copies, click Review extra PDFs…. For legacy source archives, click Review recovery archives….

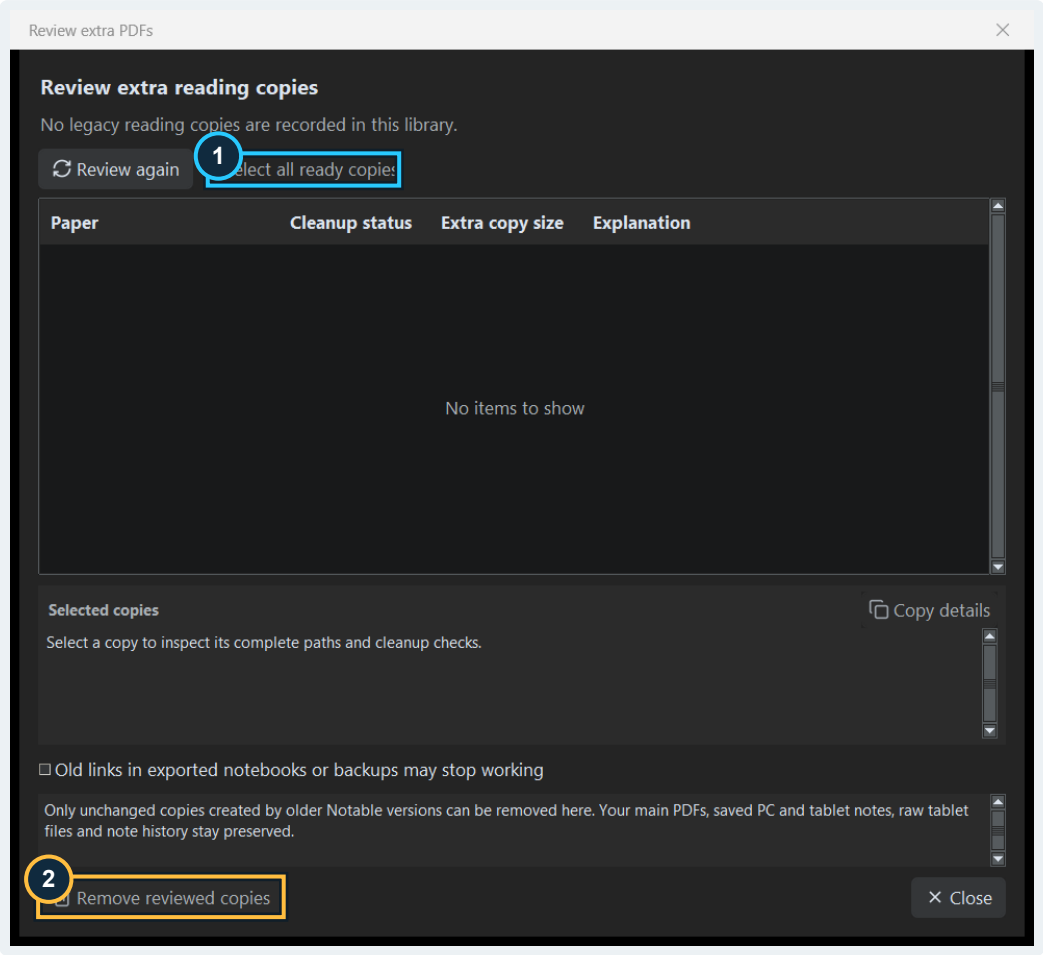

1. Inspect older reading copies **2.** Inspect legacy recovery archives

What to expect: Each review explains which exact app-created files are proven redundant and which must remain.

Compact storage or review old app copies

3. In extra-PDF review, inspect the listed copies and preservation conditions. Select only ready copies, acknowledge the link warning when required, then use Remove reviewed copies.

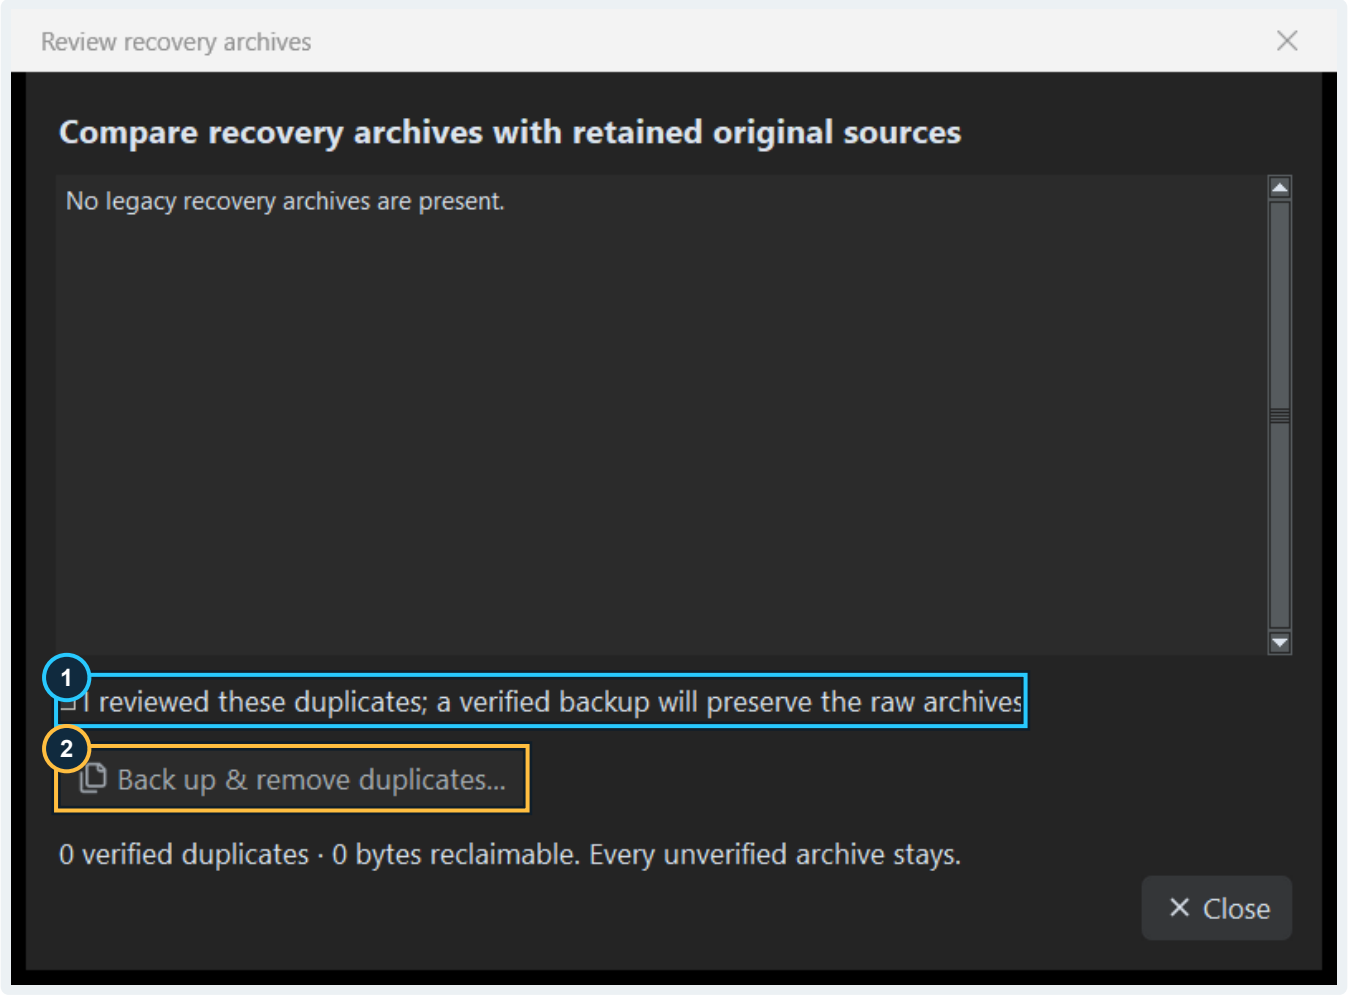

1. Select only eligible copies **2.** Act only on the reviewed selection

What to expect: Unverified files stay. Old links in previously exported notebooks or backups may stop working; current notes and verified required sources are preserved.

Compact storage or review old app copies

4. In recovery-archive review, read the exact verified duplicates, acknowledge the review and choose Back up & remove duplicates….

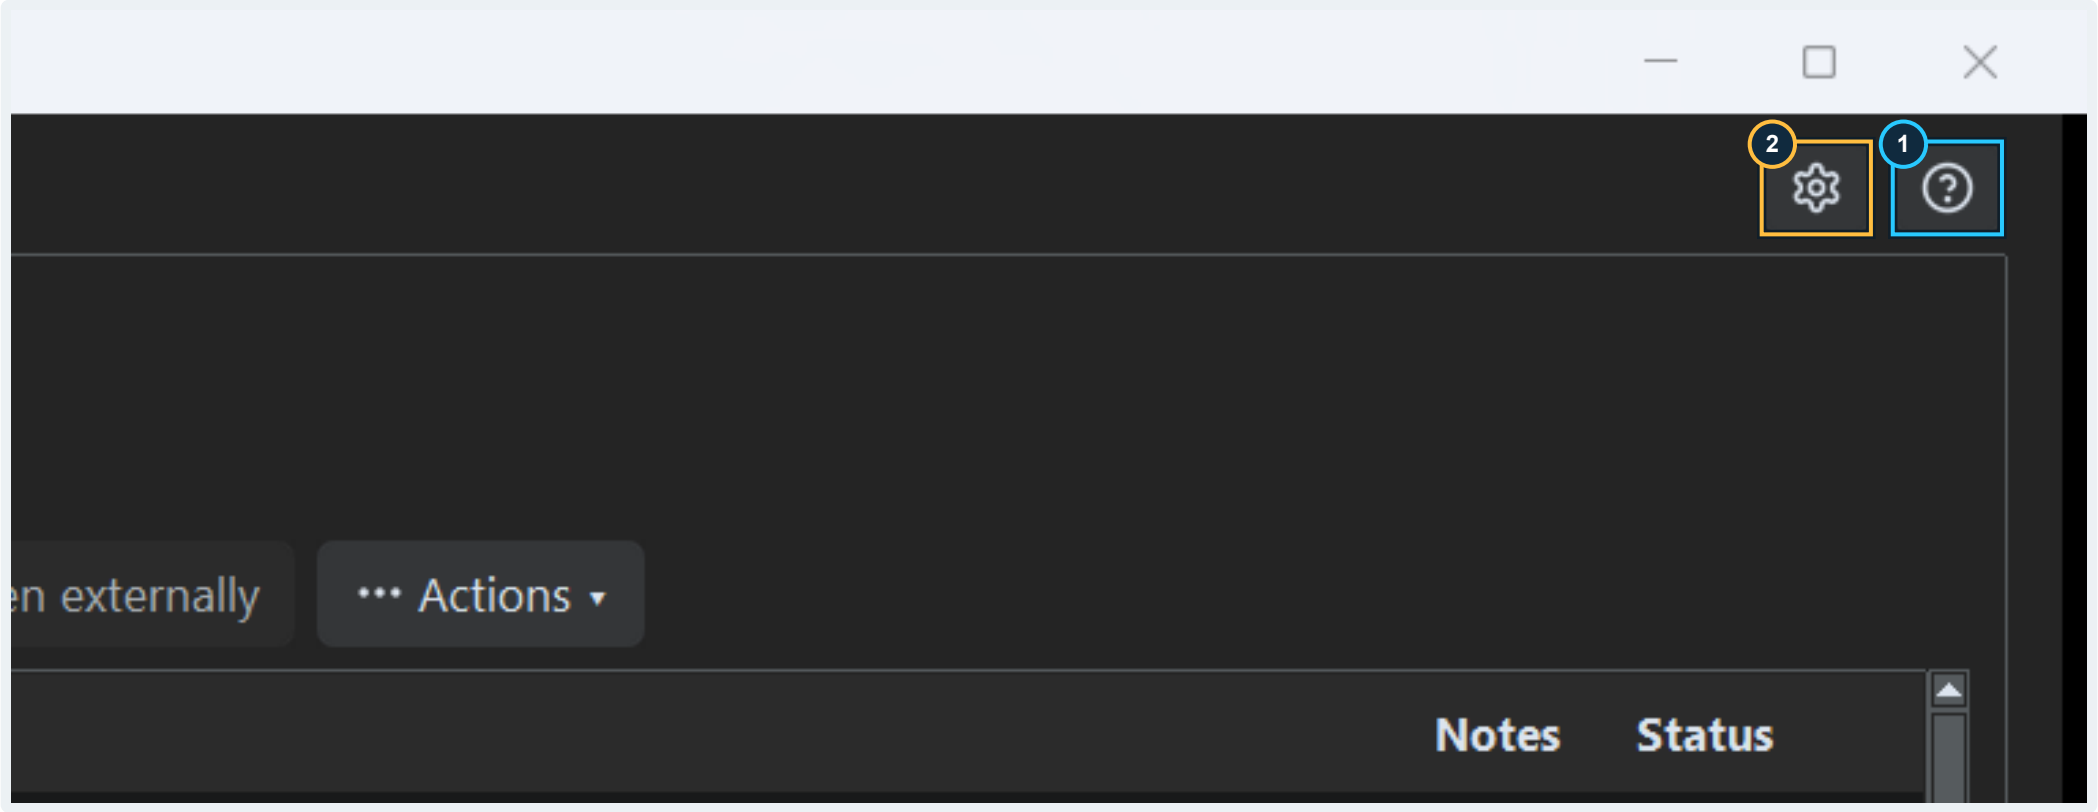

1. Acknowledge the exact verified set **2.** Back up before removal

What to expect: A complete verified backup precedes removal. Every unverified archive stays; no duplicates means the action remains disabled.

Get help, report a problem and close safely

1. Click Help (the question mark) for documentation, feedback and update checks; click Settings → Library & diagnostics for library locations.

Start here: Use this procedure to identify the active library, inspect problems or obtain the bundled guides.

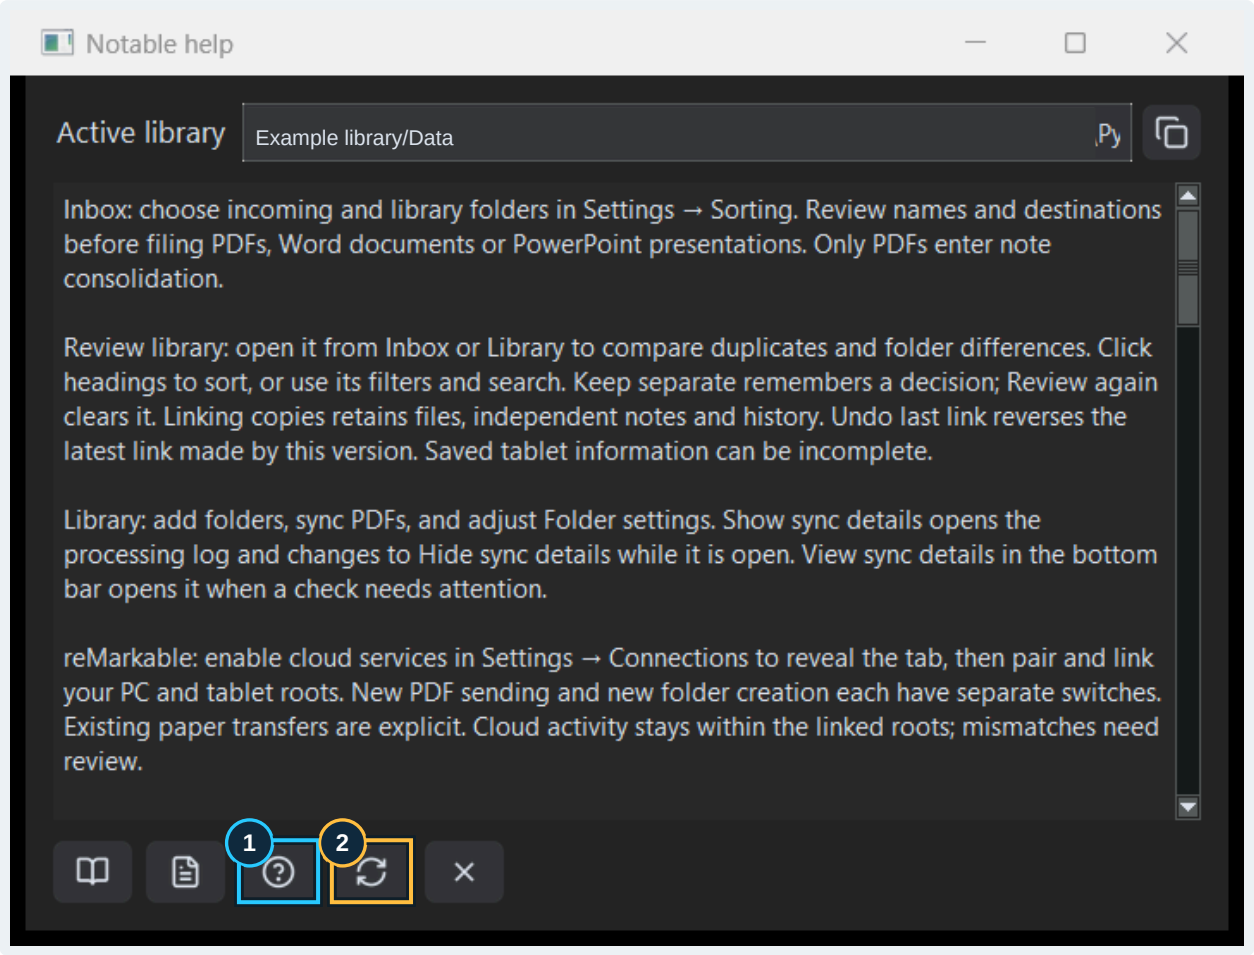

1. Open help and documentation **2.** Inspect settings and diagnostics

What to expect: Long paths can be copied. Hovering over controls explains their action; compact icon buttons retain tooltips.

Get help, report a problem and close safely

2. Use Open manual or Open README for the guides. Choose Give feedback… to prepare a report, or Check for updates… for a deliberate release check.

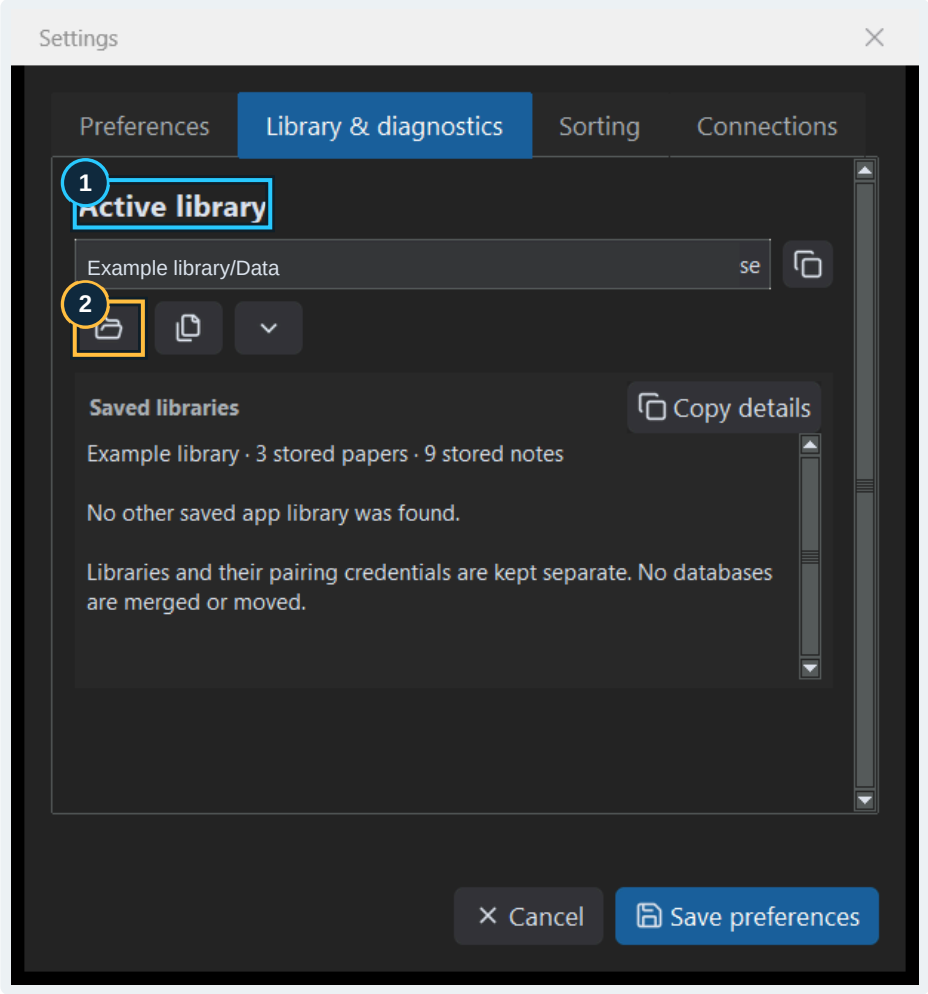

1. Prepare a reviewable report **2.** Check published release information

What to expect: Feedback opens a draft you review and send yourself. PDFs, logs, library paths and note contents are not automatically attached.

Get help, report a problem and close safely

3. Check Active library if the wrong folders appeared. Use Open data folder or Show sync details to inspect the selected library's files and activity.

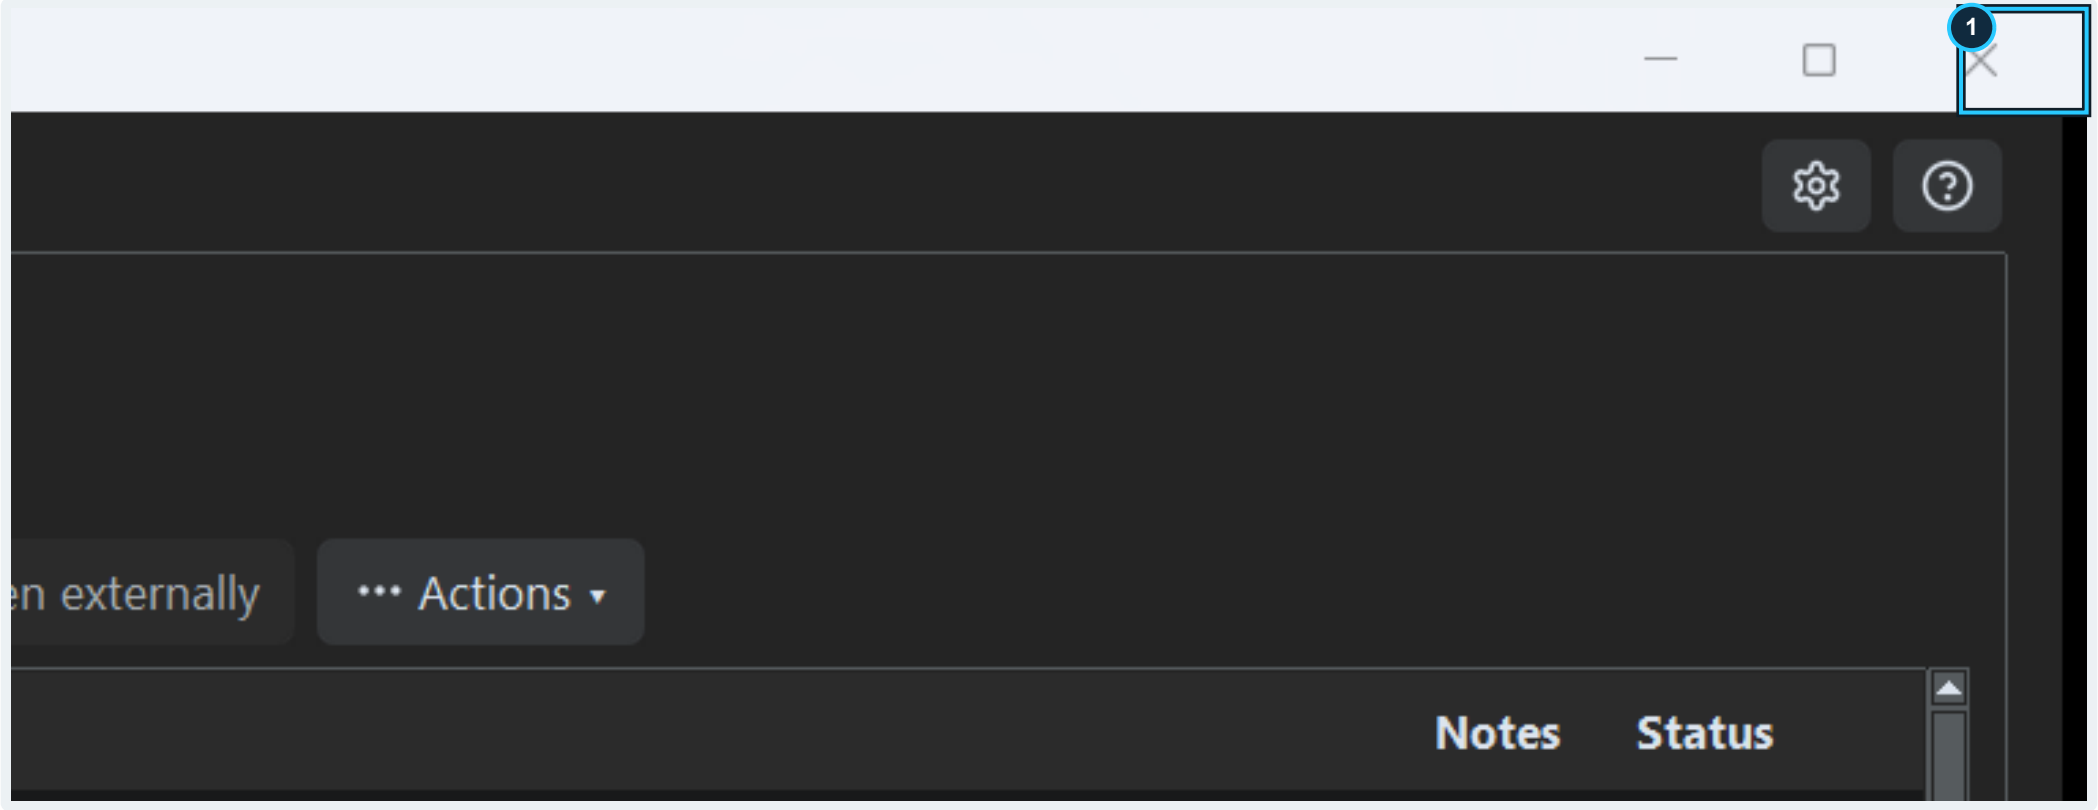

1. Confirm the saved library in use **2.** Inspect its storage location

What to expect: Packaged and source launches can use different data folders. The active path is the reliable way to distinguish them.

Get help, report a problem and close safely

4. Close Notable with the window's X. If a safe-shutdown dialog appears, wait for its named remaining task to finish.

1. Close the app after your reviewed operations finish

What to expect: The UI stays blocked during safe shutdown. Watchers stop, supported extraction cancels at safe boundaries, and completed saved work is retained before the app exits.

Keyboard and mouse reference

Where	Gesture	Action
Main app	Ctrl+F	Focus the main Reader search
Inside the PDF	Ctrl+F	Open Find in PDF for this document
Reader results	Previous / Next match	Visit main-search occurrences across results and papers
PDF Find	Enter / Shift+Enter	Next / previous PDF-only occurrence
PDF or image	Ctrl+wheel / Ctrl+drag	Zoom / pan
Inside the PDF	Ctrl+0 / Ctrl+double-click	Default mode zoom / default zoom and current-page start
Images	Ctrl+double-click	Opening zoom and top-left position
Main app	F5 / Ctrl+comma	Sync local PDFs / open Settings
Main app	Ctrl+Shift+S / Ctrl+Shift+T	Saved searches / tags and collections
File/folder lists	Double-click / Enter	Open the clicked/focused item; Library papers open in Reader
Review copies	Ctrl-click / Shift-click	Toggle individual copies / select a range
Search field or dialog	Escape	Clear the main query / follow Cancel or Close
